When we ask deep questions about Nature we are led deep into the world of mathematics

$y^3 + z^3 + xy - 6 = 0$
 $\sin x$
 $\cos x$
 $g \cdot \partial f = \left(\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right)$
 $Y_{i+1} = Y_i + b \cdot K_2$
 $B = \begin{pmatrix} 2 & 1 & -1 & 0 \\ 3 & 0 & 1 & 2 \end{pmatrix}$
 $\sum_{i=0}^n (p_z(x_i) - y_i)^2$
 $\operatorname{tg} 2x = \frac{2 \operatorname{tg} x}{1 - \operatorname{tg}^2 x}$
 $\operatorname{tg} x = \frac{\sin x}{\cos x}$
 $\lim_{n \rightarrow \infty} \sqrt[3]{3n^2 + 2n - 1}$
 $\int \int \int_M z dx dy dz = \int_0^{\pi} \left(\int_0^2 \left(\int_{\frac{1}{2}r}^1 nr d\sigma \right) dr \right) d\varphi$
 $x - x = 0, I = (1, 10)$
 $\int_0^4 x \cdot \cos^3 x dx$
 $\cos^2 \beta + \cos^2 \mu = 1$
 $\delta(p_2) = \sqrt{0.16}$
 $\vec{n} = (F_x, F_y, F_z)$
 $\frac{\partial z}{\partial y} = 0$
 $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 0$
 $= 2 \sin x \cdot \cos x$
 $|z| = \sqrt{a^2 + b^2}$
 $\frac{\partial f}{\partial x} = 16 - x^2 + 16y^2 - 4z > 0$
 $\lim_{x \rightarrow 0} \frac{e^{2x} - 1}{5x} = \frac{2}{5}$
 $e^2 - xyz = e, A[0; e; 1]$
 $b<|\beta|<0, \mu \neq 0$
 $A = \begin{pmatrix} x, 1+x^2, 1 \\ y, 1+y^2, 1 \\ z, 1+z^2, 1 \end{pmatrix}; x=0, y=1, z=2$
 $A = [1; 0; 3]$
 $\int 3x^2 + 1.66x^{-0.17} dx \lim_{b \rightarrow +\infty} \left(1 + \frac{3}{n} \right)^n$
 $g \cdot \partial f = \left(\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right)$
 $\operatorname{tg} x \cdot \operatorname{cotg} x = 1$
 $B = \begin{pmatrix} 2 & 1 & -1 & 0 \\ 3 & 0 & 1 & 2 \end{pmatrix}$
 $a^2 = b^2 + c^2 - 2bc \cos \alpha$
 $\operatorname{tg} \frac{x}{2} = \frac{1 - \cos x}{\sin x} = \frac{\sin x}{1 + \cos x}$
 $2x^2 yy' + y^2 = 2$
 $x_1 = -11p, x_2 = -p, x_3 = 7p, p \in \mathbb{R}$
 $\lambda_x - y + z = 1$
 $x + \lambda y + z = \lambda^2$
 $x + y + \lambda z = \lambda^2$
 $\operatorname{tg} x = \frac{\sin x}{\cos x}$
 $F_2 = 2 \times yz - 1 = 1$
 $X_1 = \begin{pmatrix} 2p \\ -p \\ 0 \end{pmatrix}$
 $y = x^3$
 $y = x^2$
 $y = x^4$
 $(1+e^x)yy' = e^x$
 $y(1) = 1$
 $\cos 2x = \cos^2 x - \sin^2 x$
 $\sin^2 x + \cos^2 x = 1$
 $\sqrt{P(x, \frac{\sqrt{ax+b}}{cx+d})} dx$
 $\frac{\sin x}{x} \leq \frac{x}{x} = 1$
 $\lambda_2 = i\sqrt{14}$
 $\eta_1 = \lambda_1^2 - 3\lambda_1 + 1 \neq 0$
 $\sin(x+y) = \sin x \cos y + \cos x \sin y$
 $y' - \frac{\sqrt{y}}{x+2} = 0; y(0) = 1$
 $\cos \rho = \frac{(1, 0) \cdot (\frac{1}{2\sqrt{3}}, \frac{1}{4\sqrt{3}})}{\sqrt{\frac{1}{12} + \frac{1}{48}}}$
 $b^2 = c \cdot c_b$
 $a^2 = c \cdot c_a$

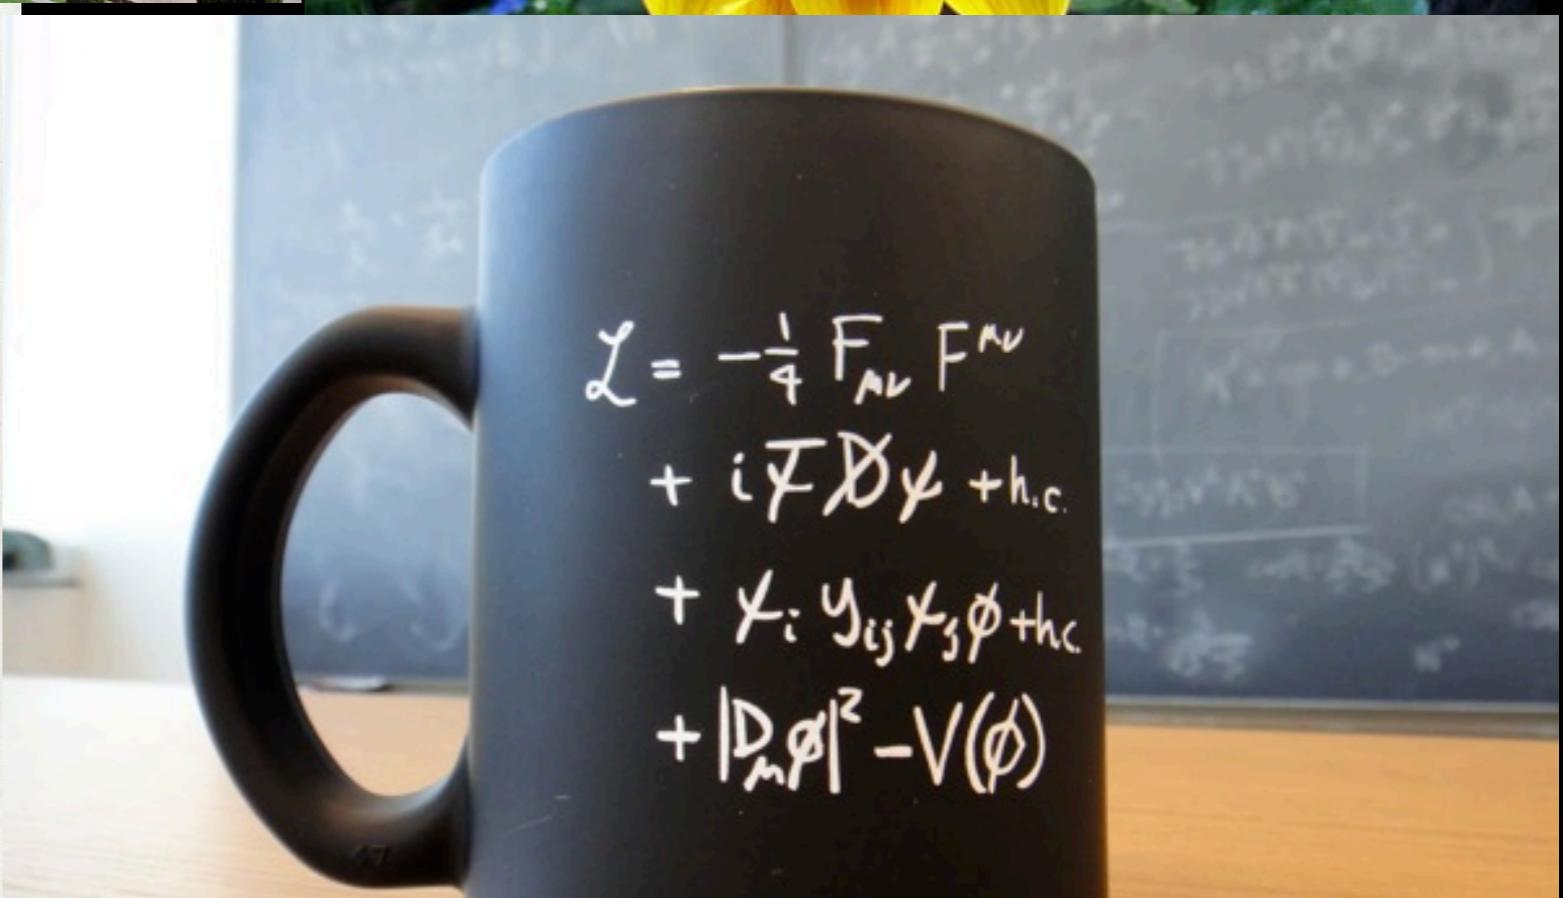

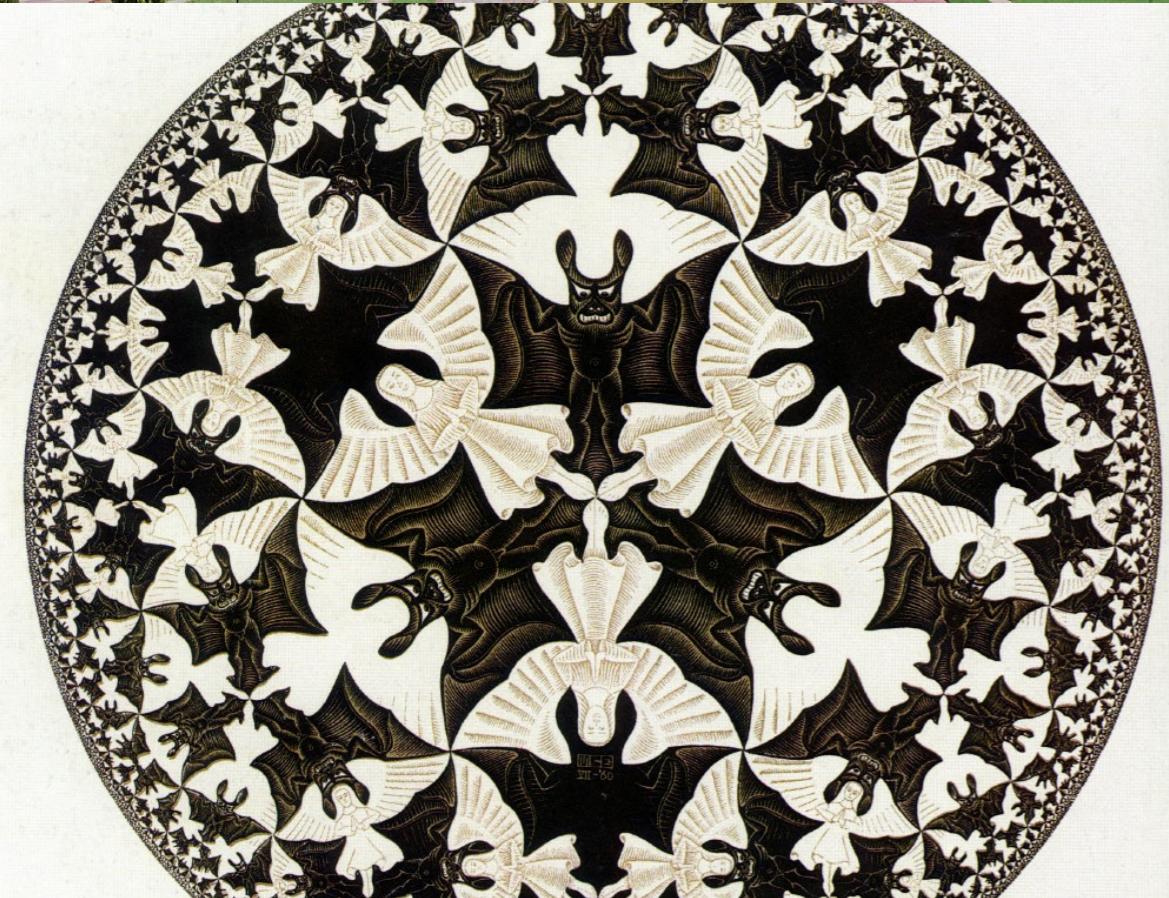

How can it be that mathematics, being after all a product of human thought which is independent of experience, is so admirably appropriate to the objects of reality?

- A. Einstein

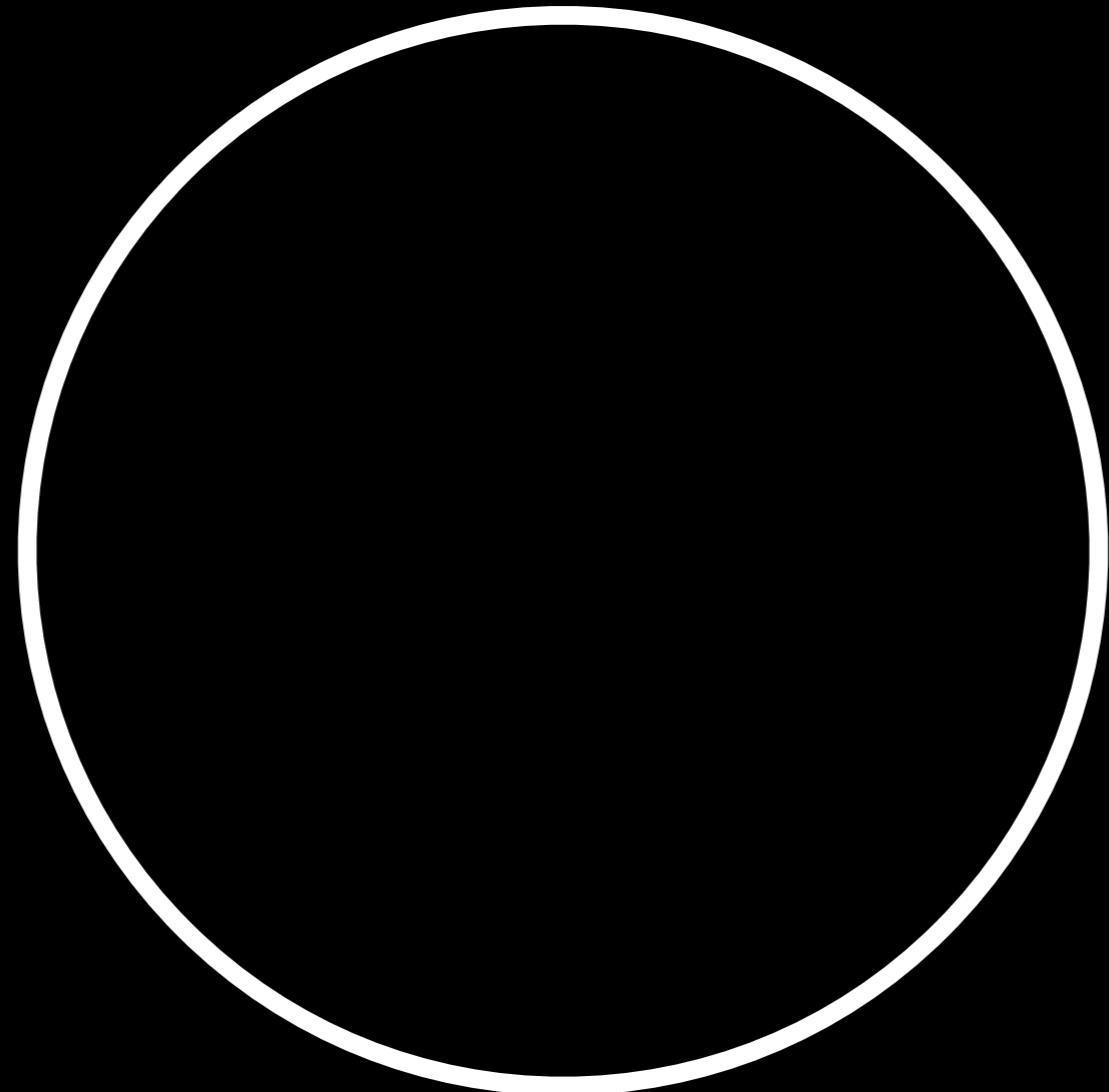

Nature strives for **symmetry**

Symmetries

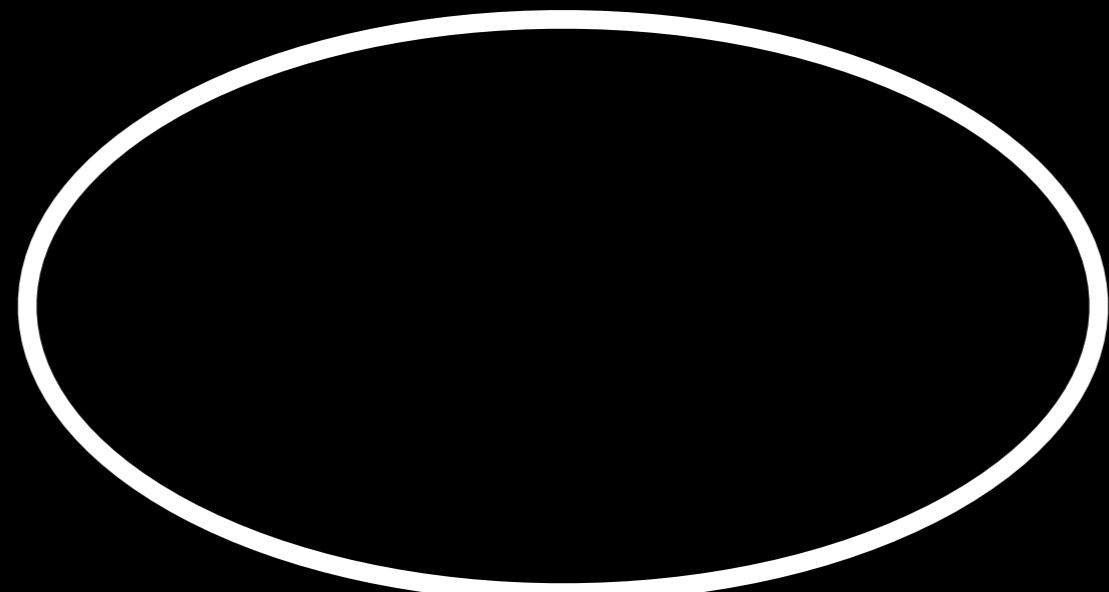

Transformations that leave a geometric object invariant

A circle has infinitely many rotational symmetries

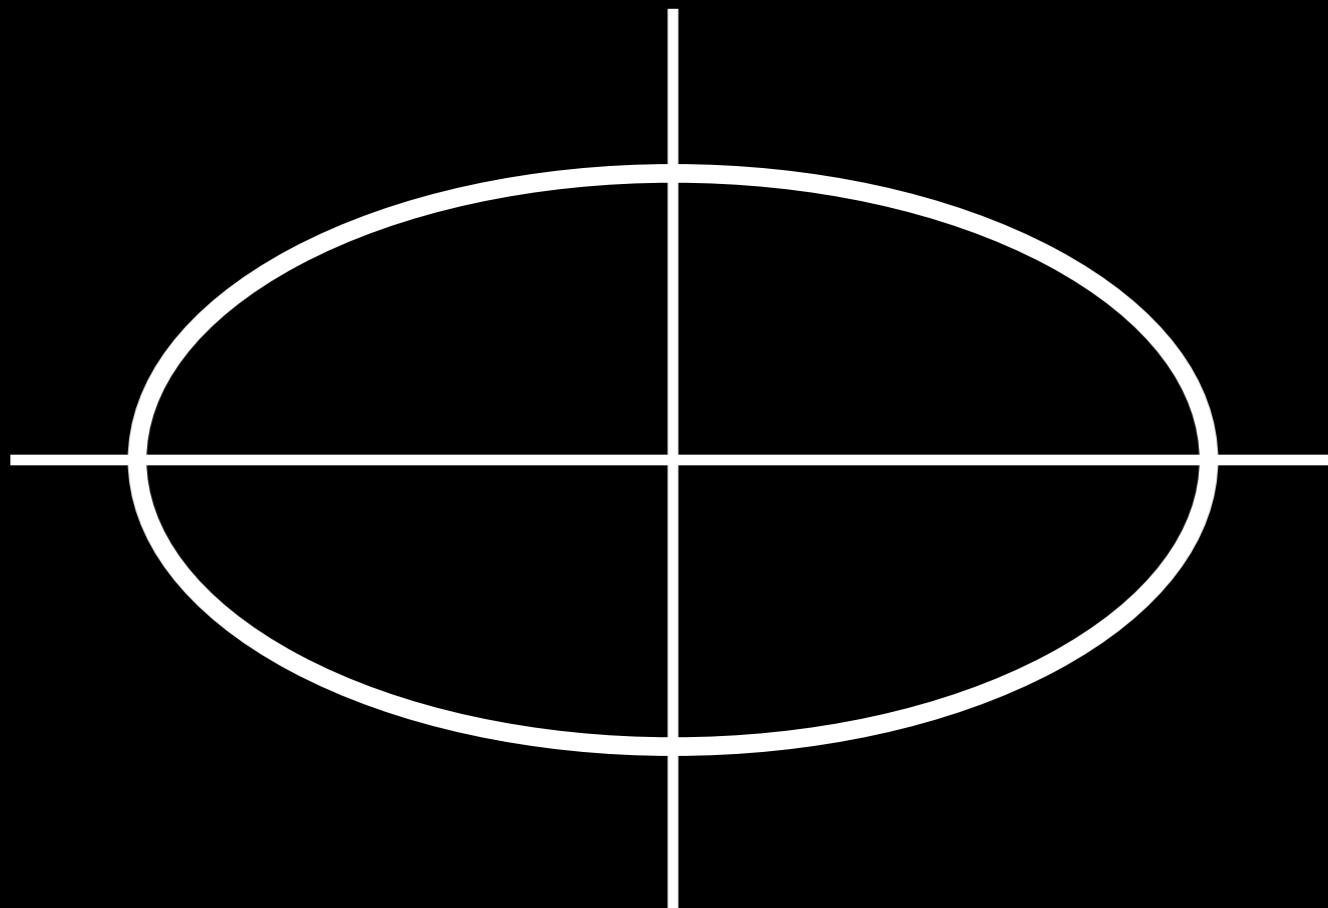

Symmetries

Transformations that leave a geometric object invariant

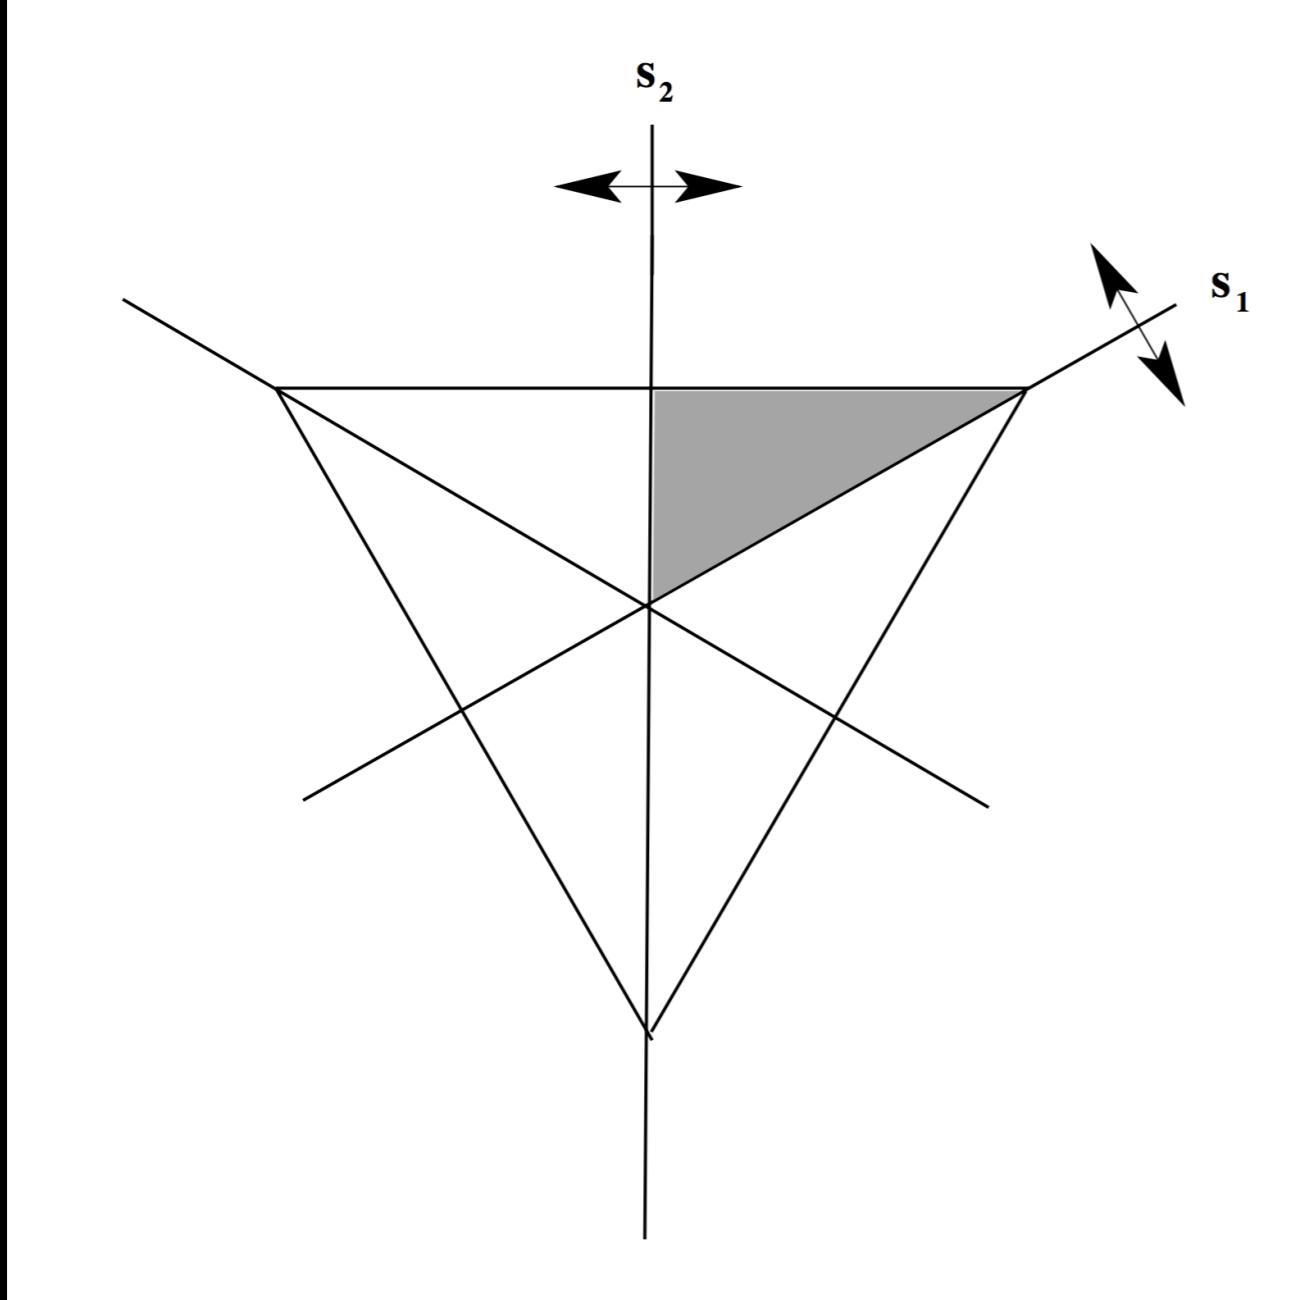

Symmetries

Transformations that leave a geometric object invariant

Finite **reflection**
symmetry

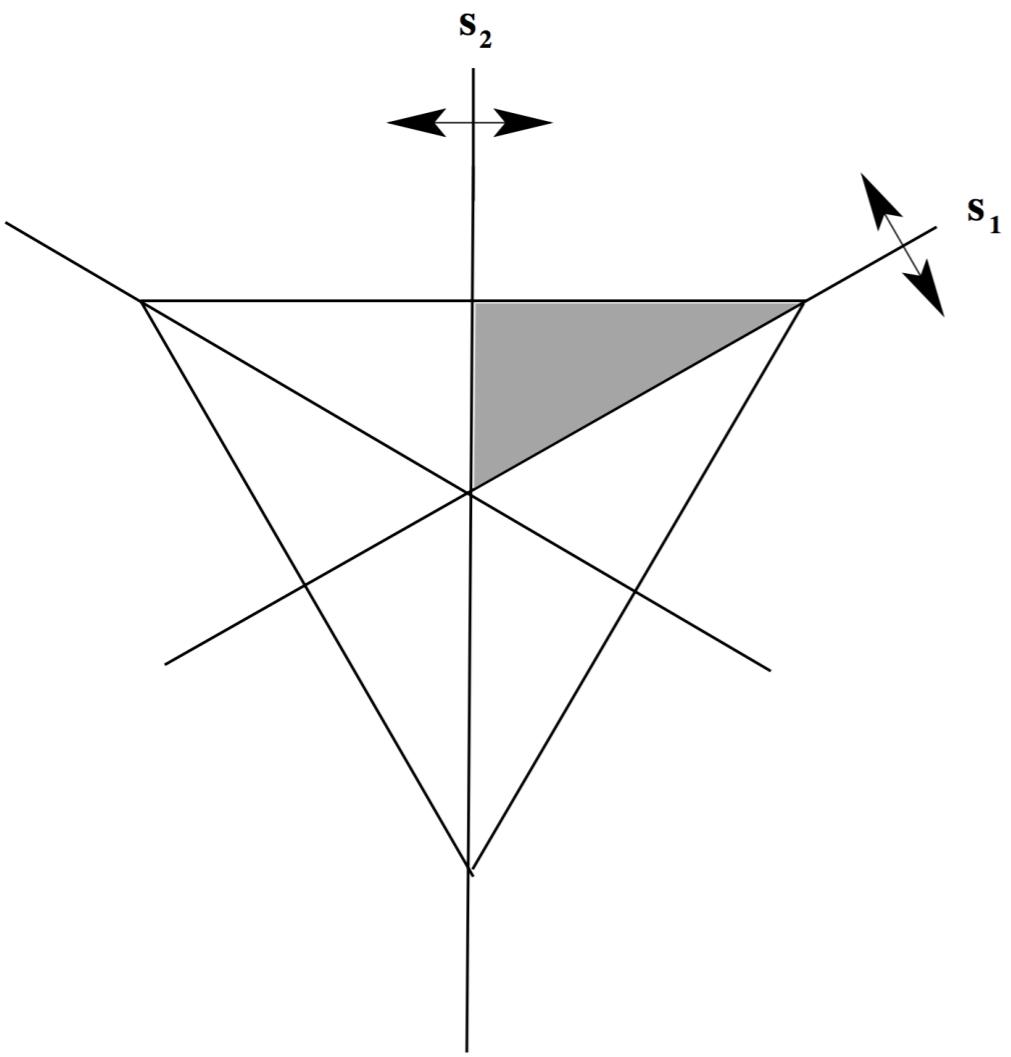

A triangle has 6 symmetries

3 rotations

3 reflections

All these are generated by two reflections: S1 och S2

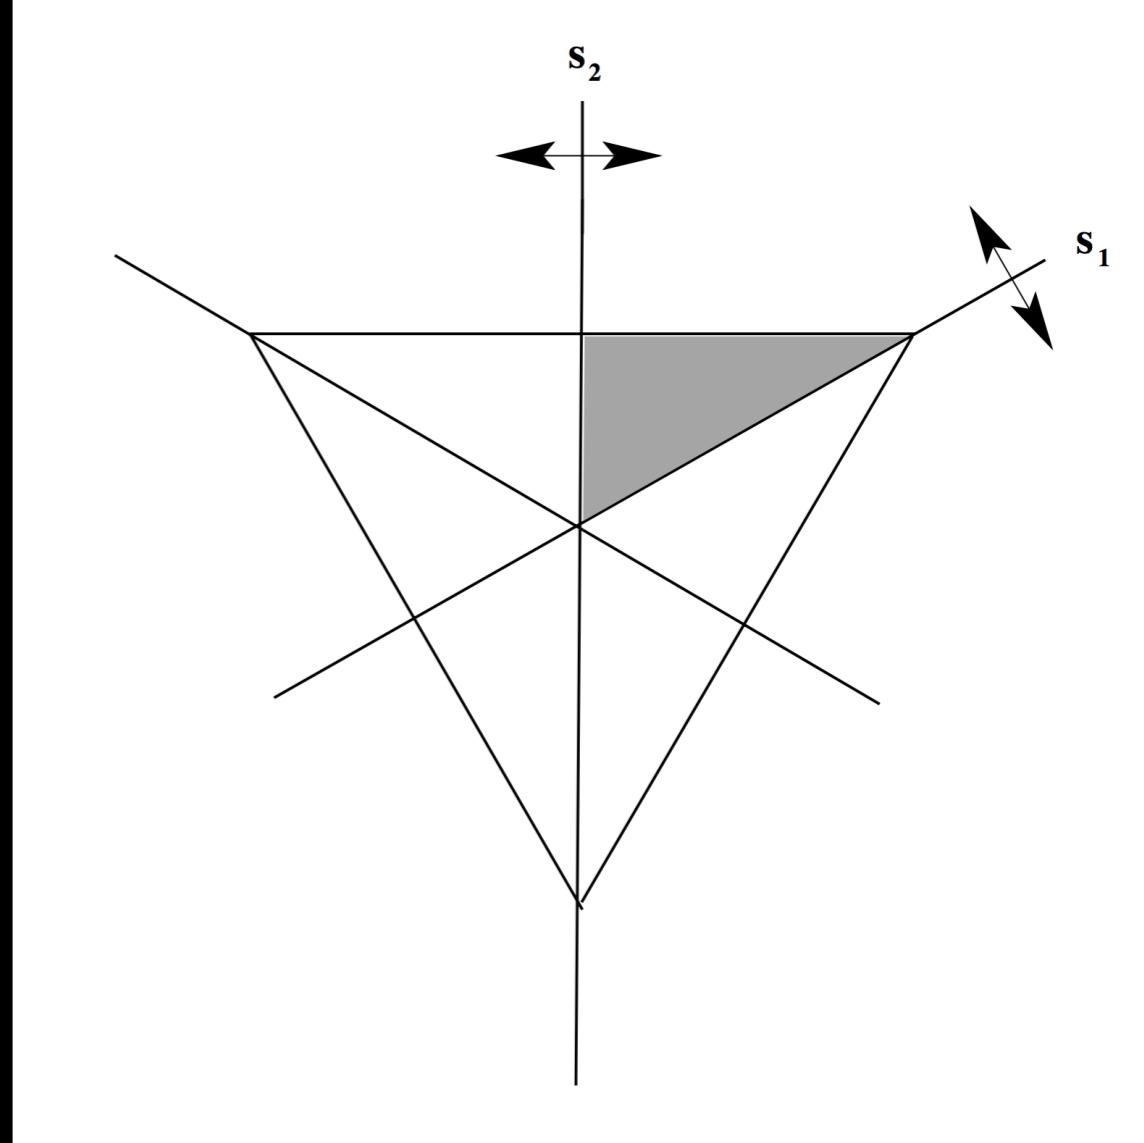

Symmetry transformations form a mathematical object called a **group**.

Key property: The combination of two transformations must also be a symmetry

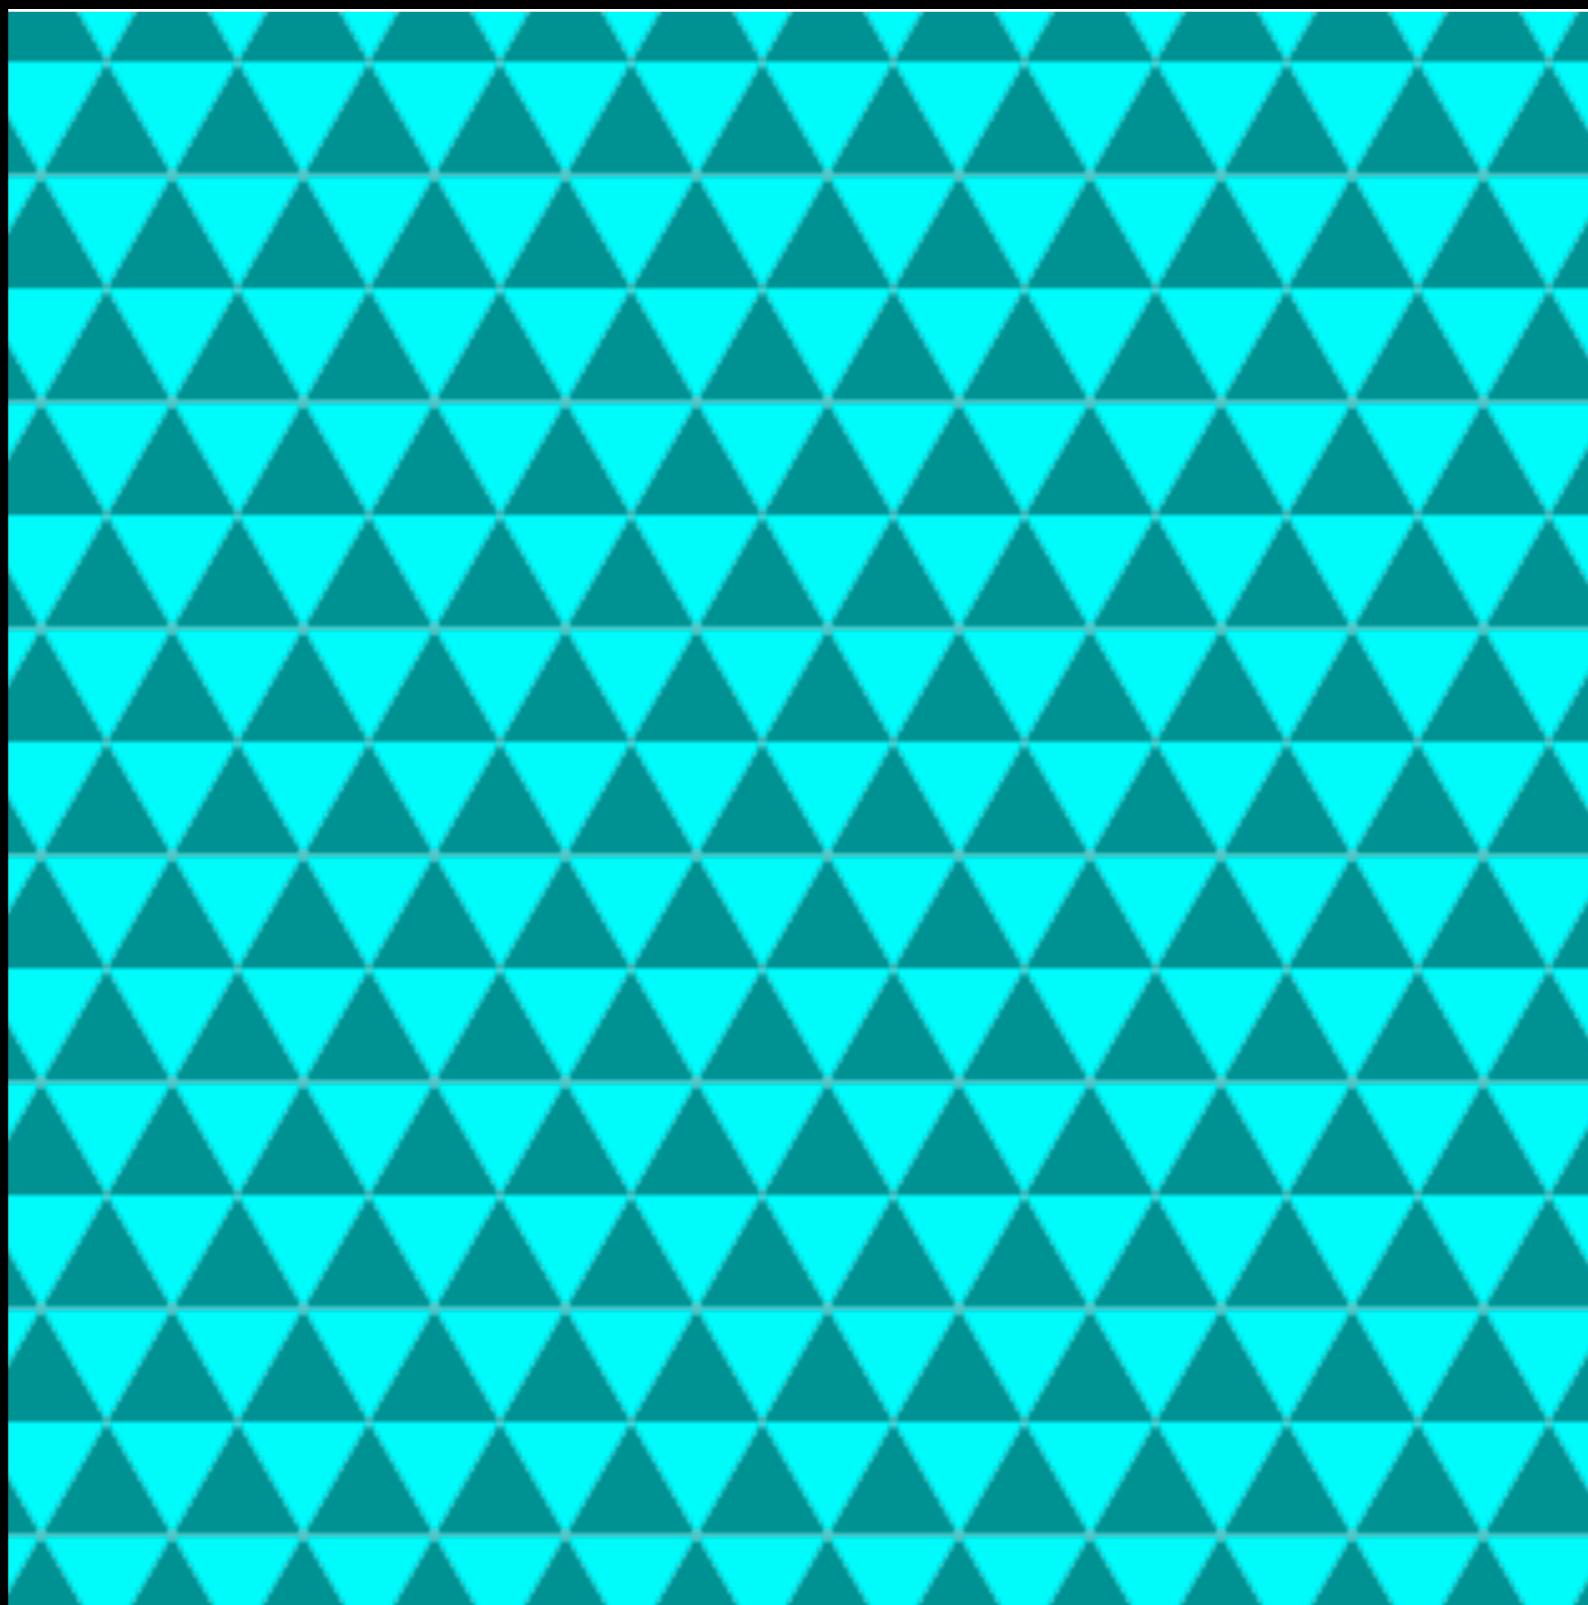

Symmetry transformations form a mathematical object called a ***group***.

Key property: The combination of two transformations must also be a symmetry

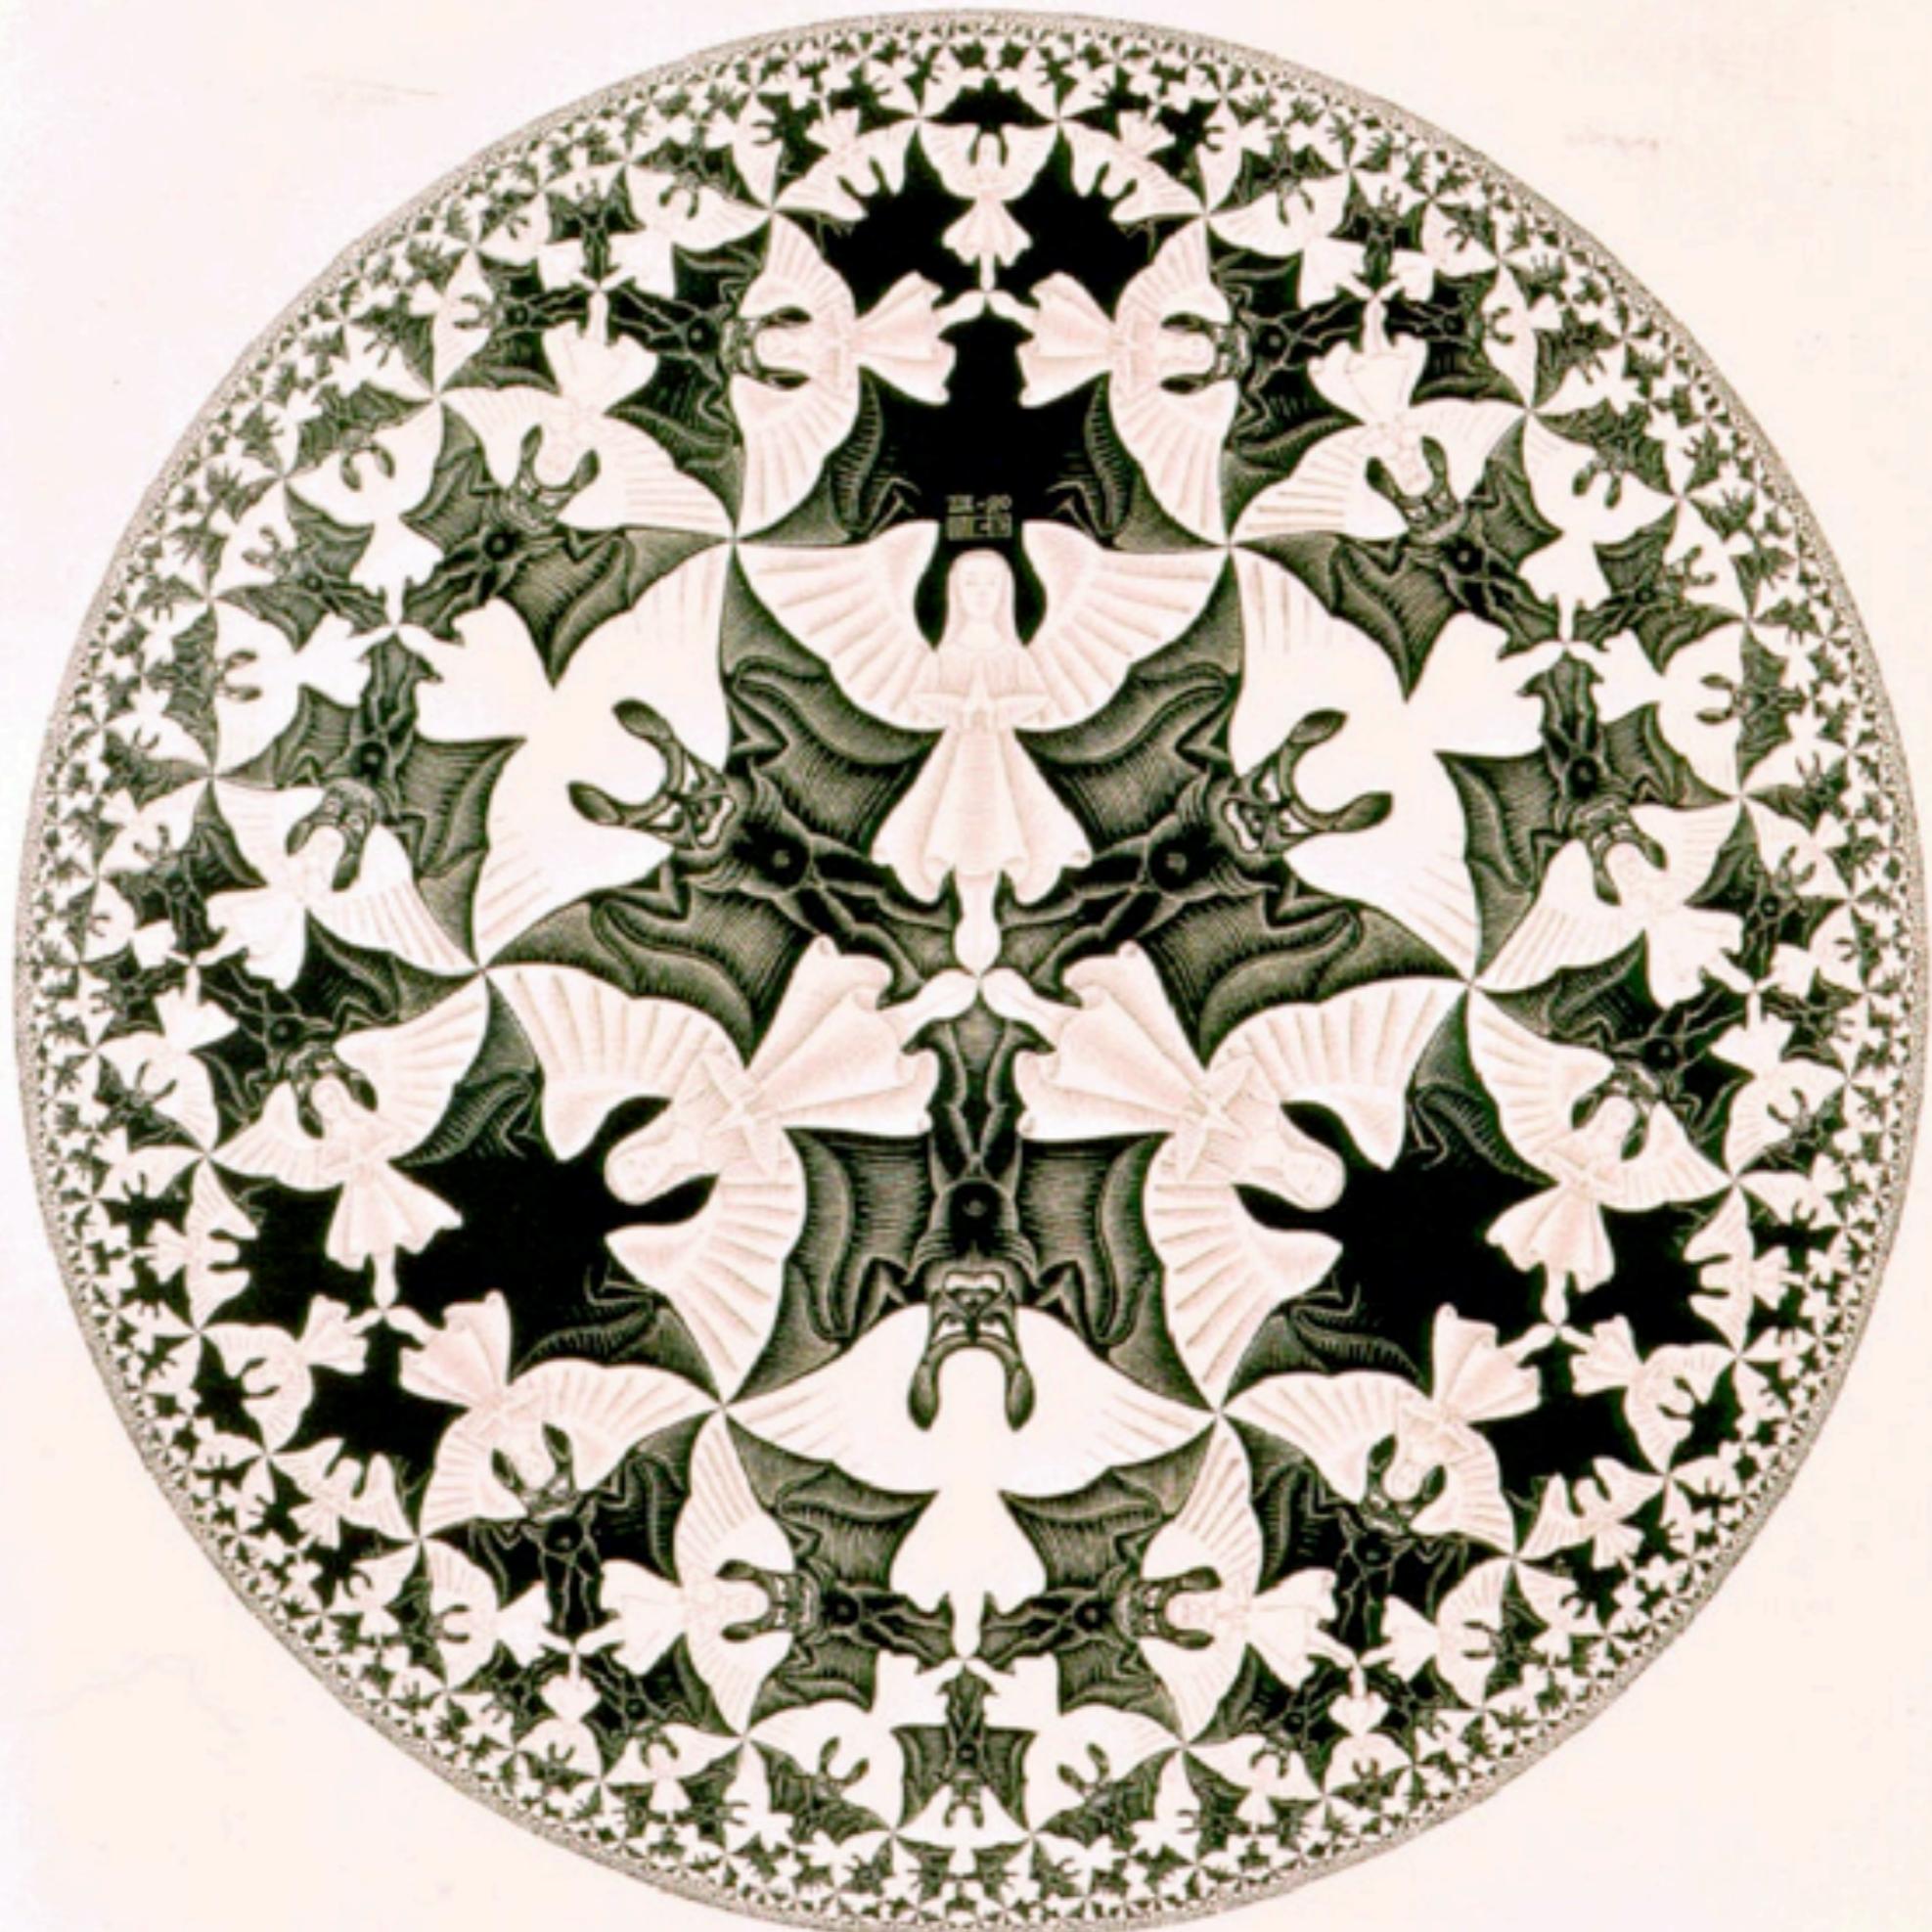

Translation is not a symmetry of the triangle!

But a **tesselation** of the plane by triangles has translational symmetry!

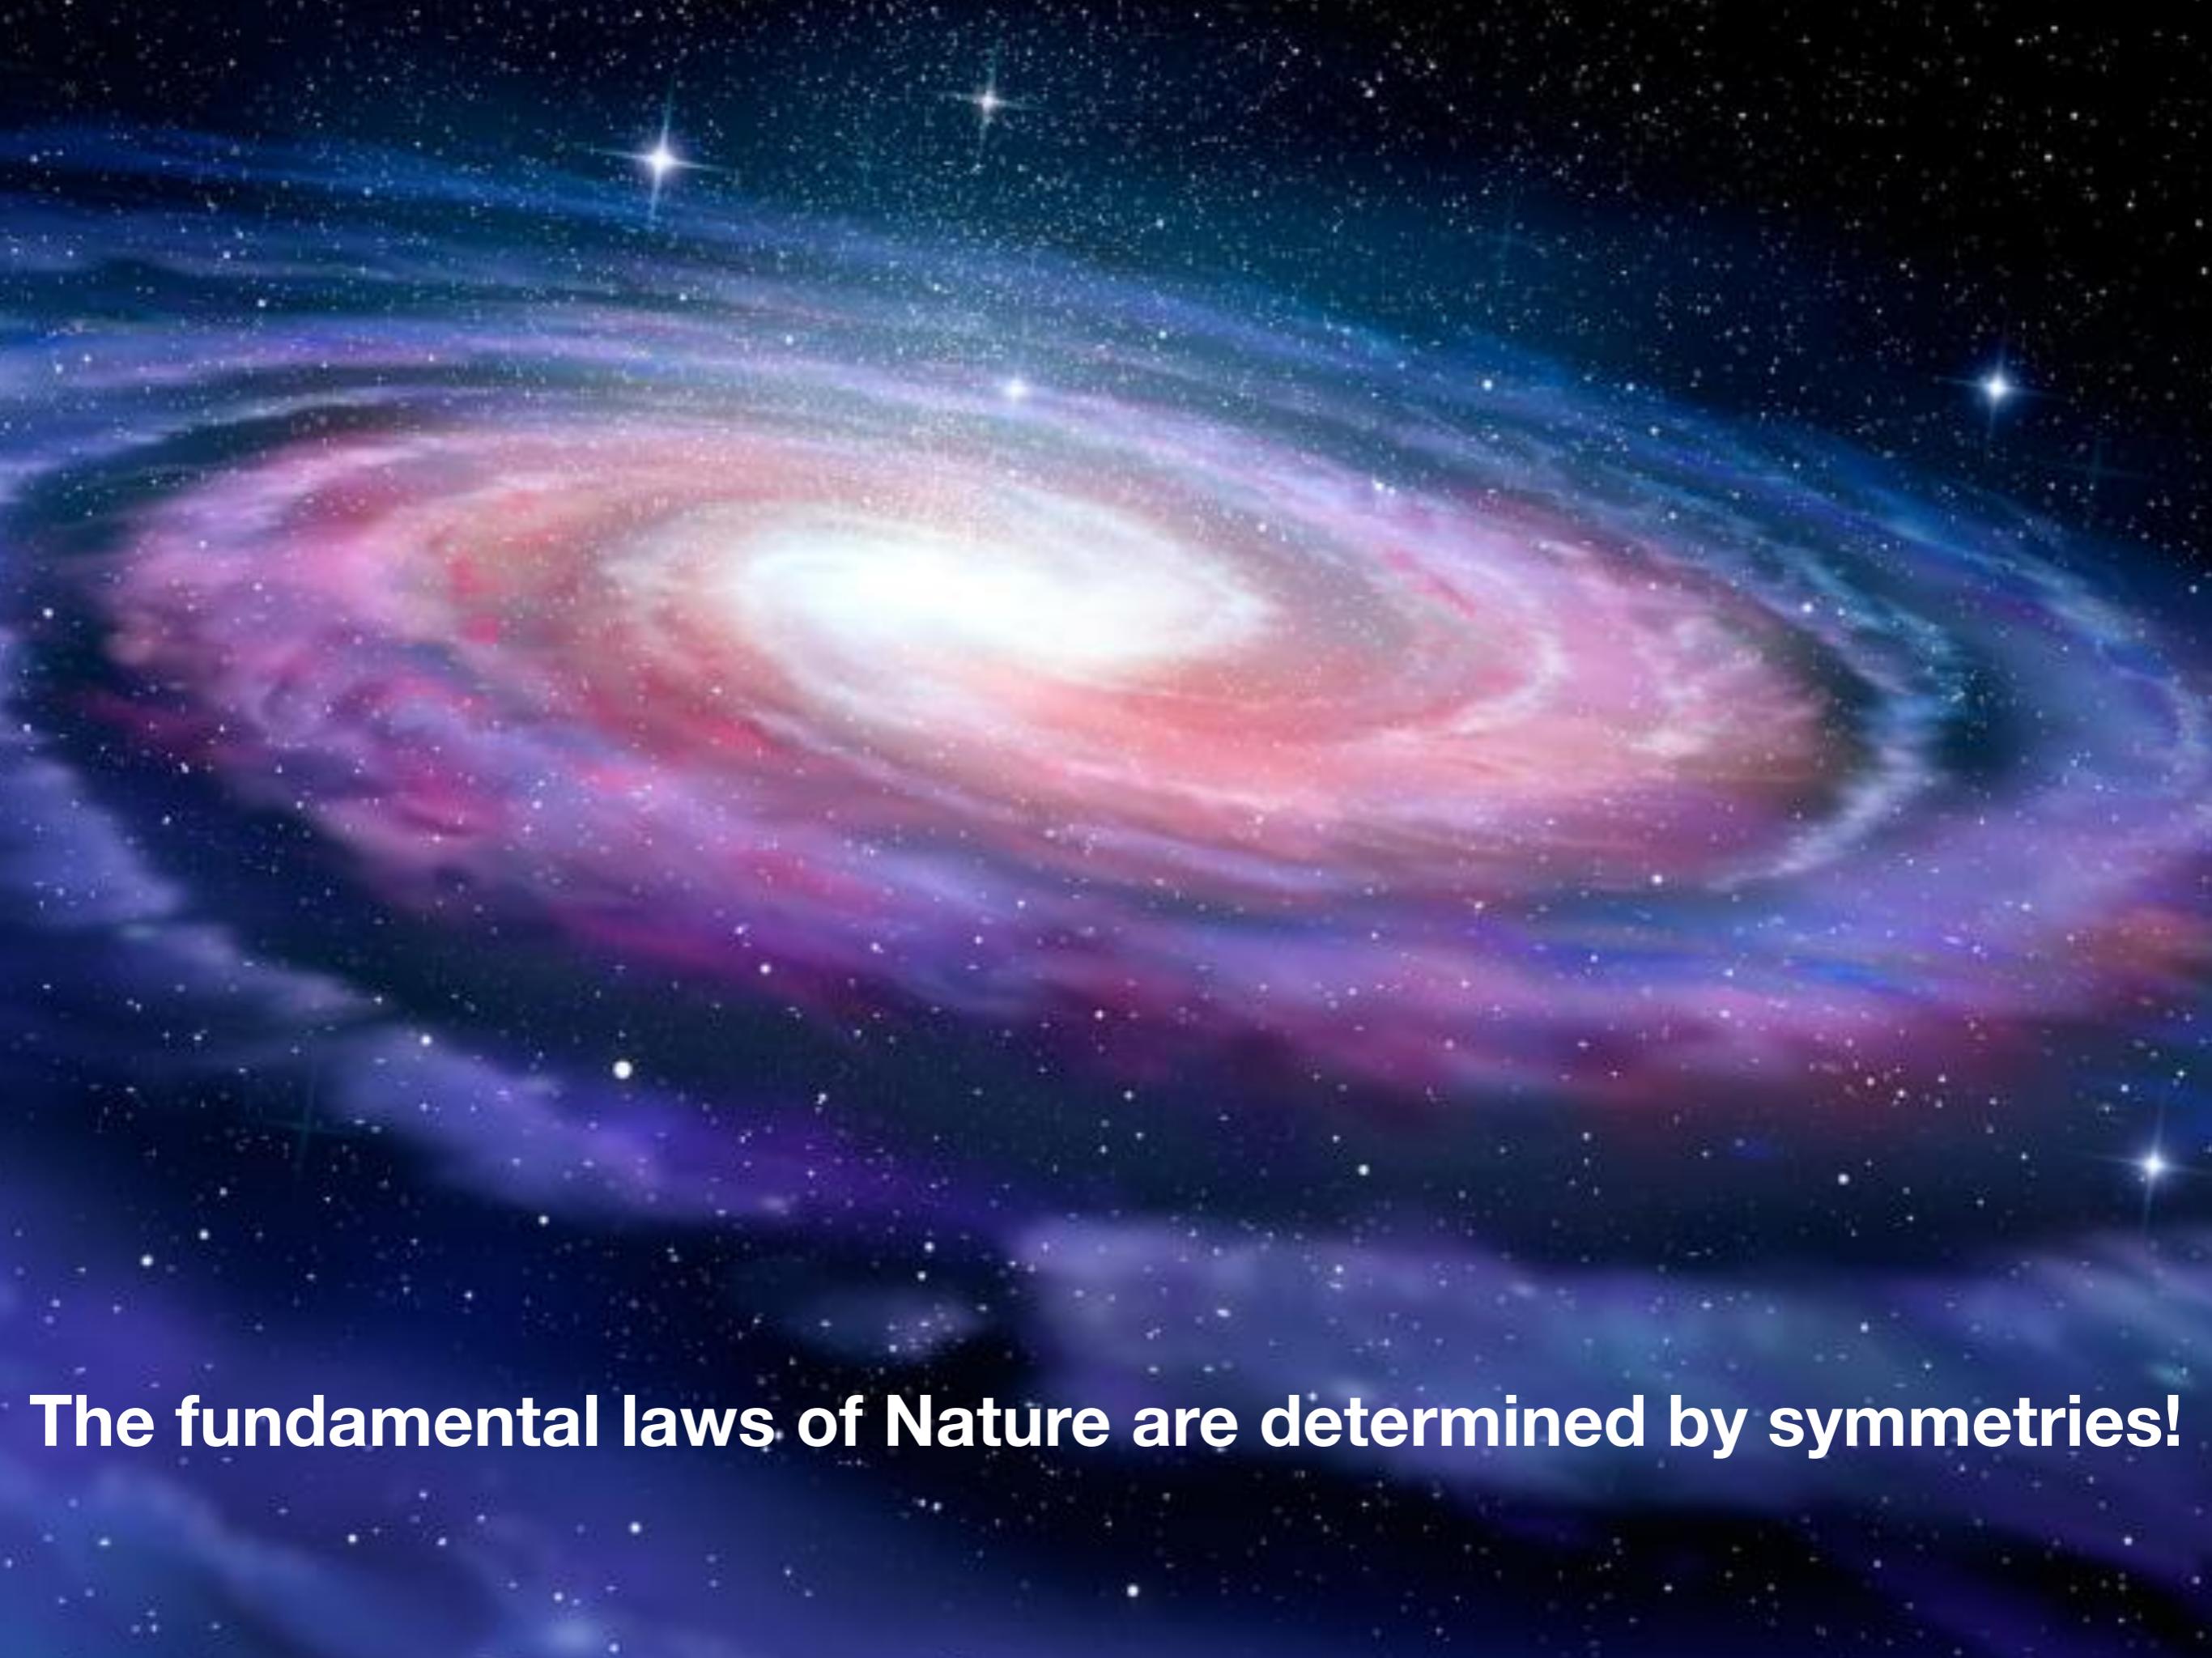

$$\Psi_{g,h}(\sigma,\tau,z) := \exp\left[\sum_{L=1}^\infty p^L {\mathcal T}_L^\alpha \phi_{g,h}(\tau,z)\right]$$

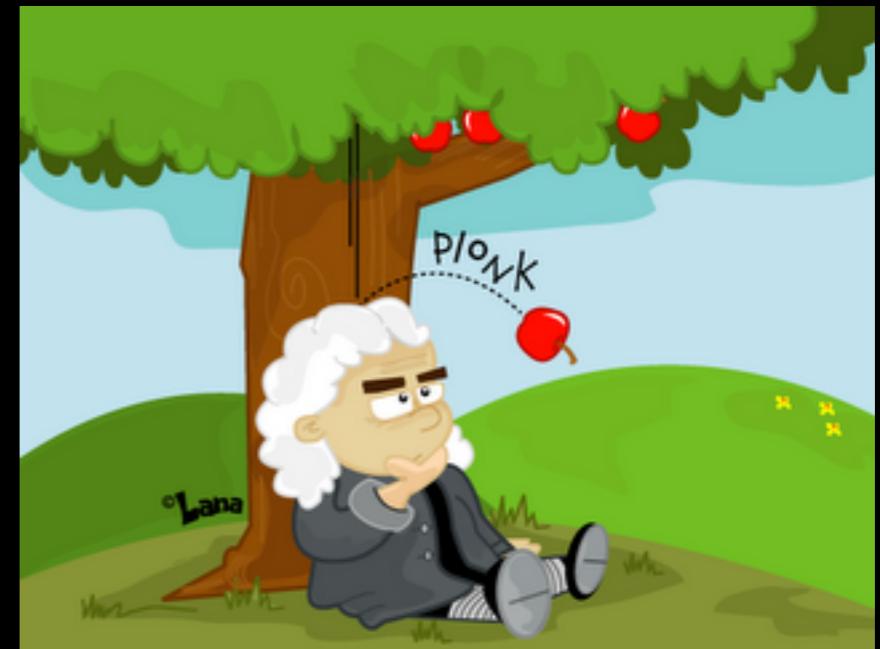

$$\chi(K3;\tau,z)=\frac{\vartheta_1(\tau,z)^2}{\eta(\tau)^3}\left(24\mu(\tau,z)+q^{-1/8}(-2+\sum_{n=1}^\infty A_nq^n)\right)$$

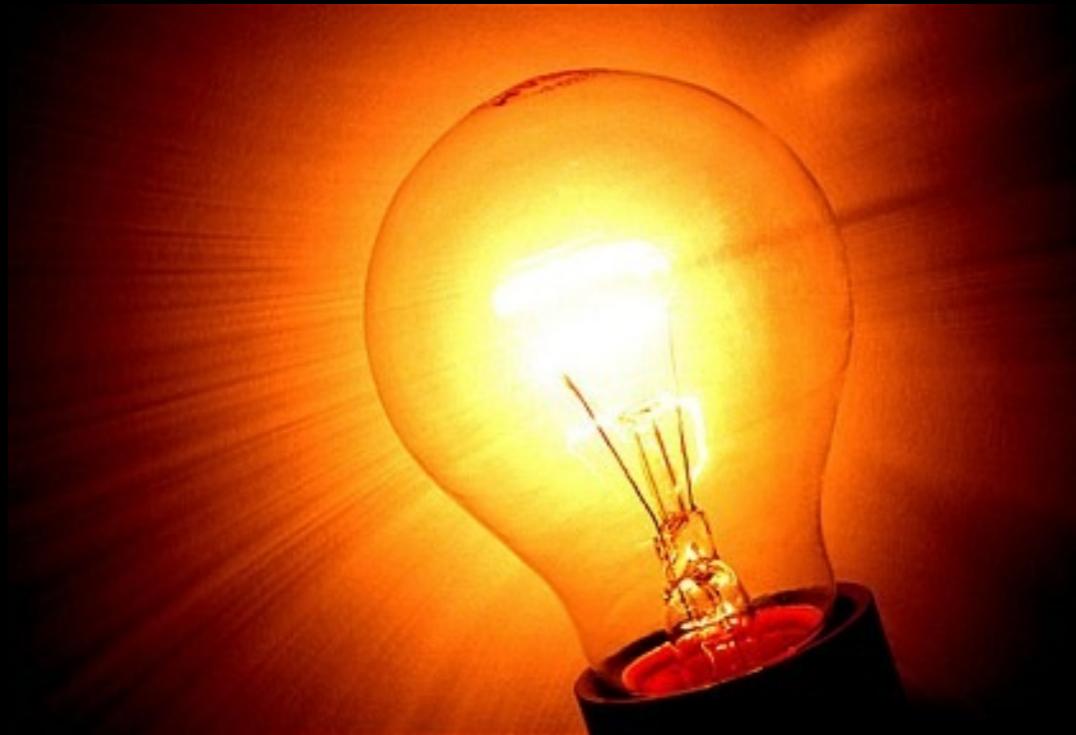

The fundamental laws of Nature are determined by symmetries!

What is a black hole?

What is a black hole?

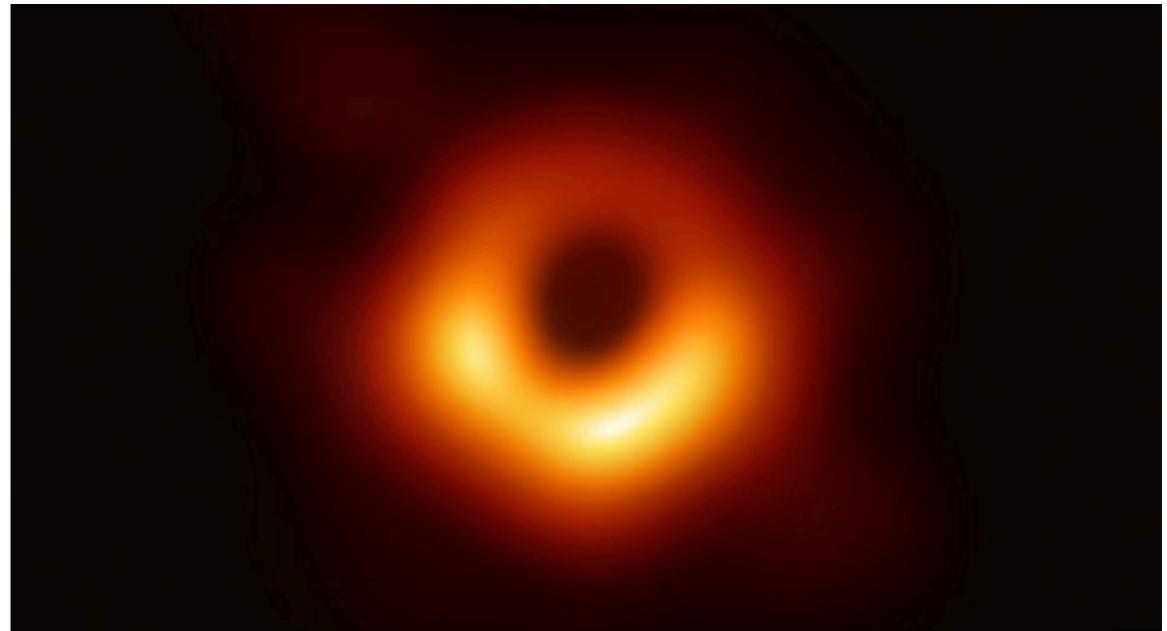

**Einstein's equations
describes the curvature of
spacetime**

$$R_{\mu\nu}(g) - \frac{1}{2}g_{\mu\nu}R(g) = T_{\mu\nu}(g, F, \dots)$$

What is a black hole?

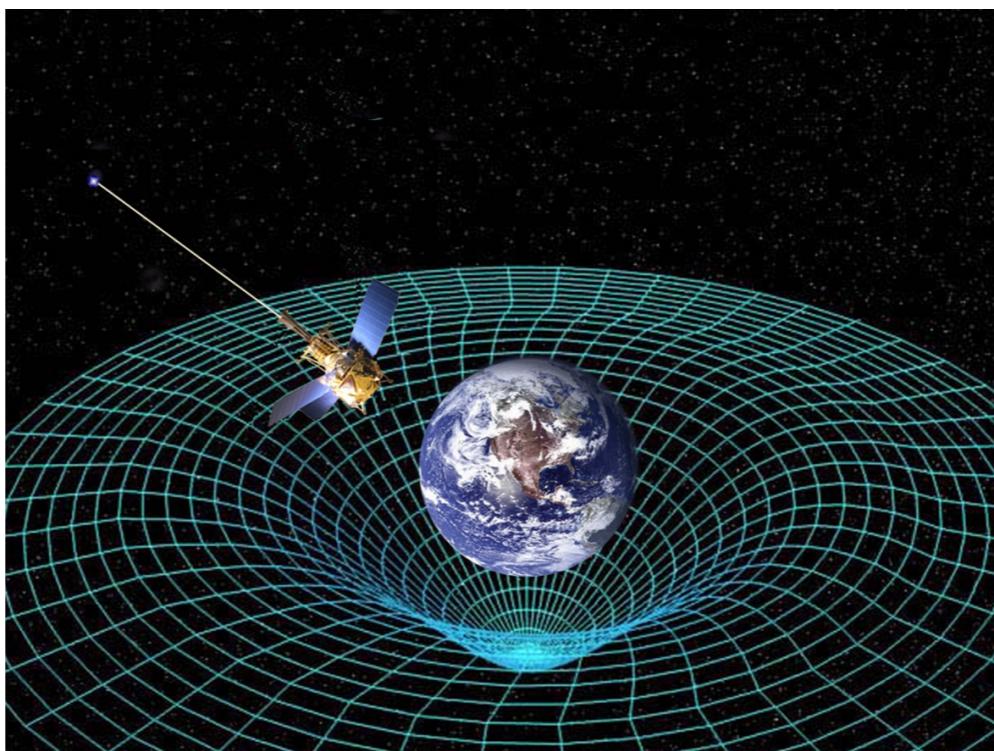

Einstein's equations
describes the curvature of
spacetime

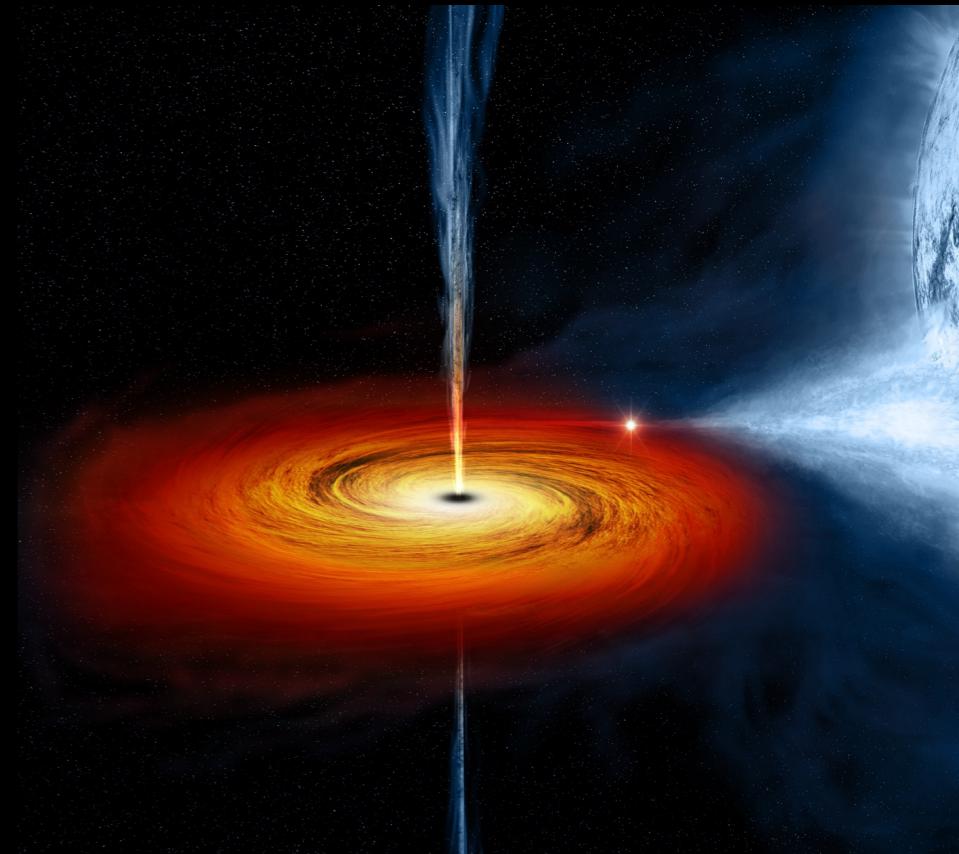

$$R_{\mu\nu}(g) - \frac{1}{2}g_{\mu\nu}R(g) = T_{\mu\nu}(g, F, \dots)$$

geometry

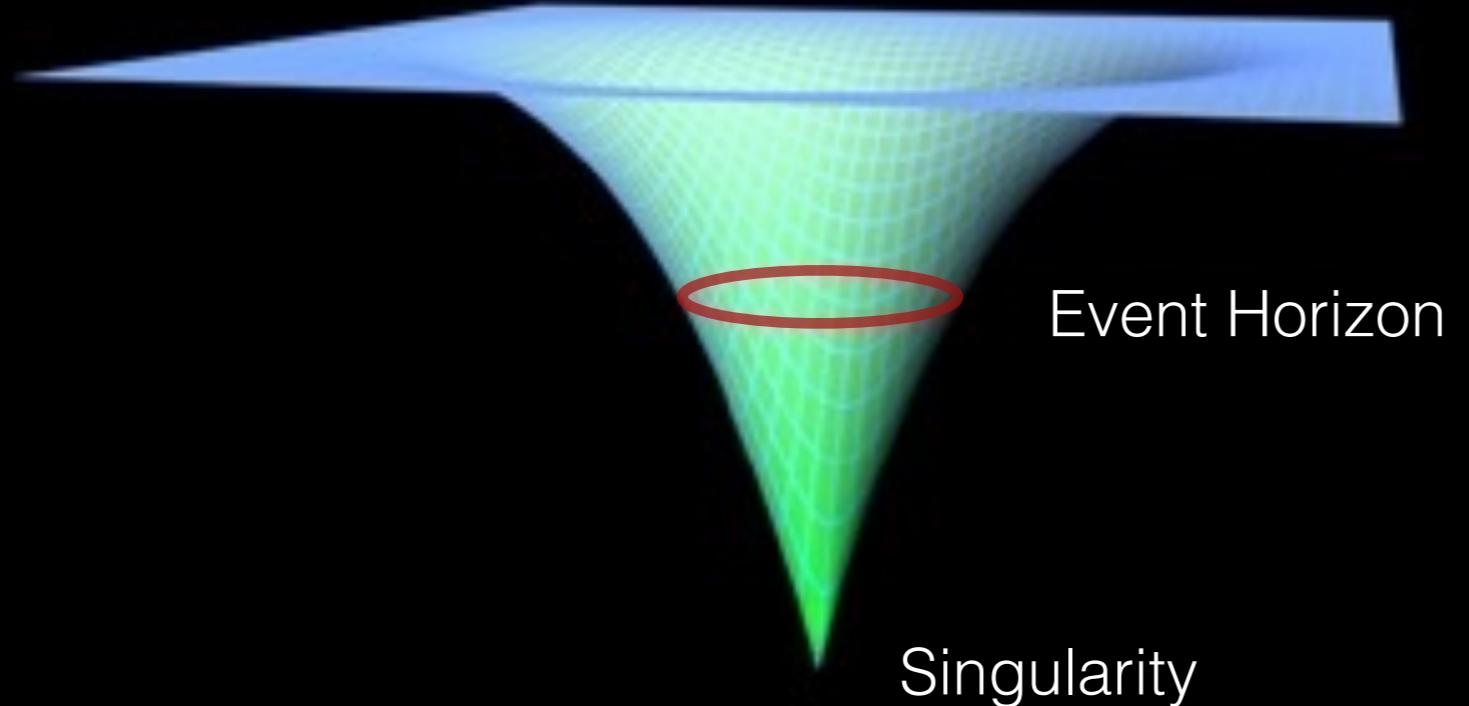

matter

A black hole forms in the final stage of the collapse of a sufficiently large star

At its centre space and time break down into a **singularity**

**Do quantum effects
resolve the singularity?**

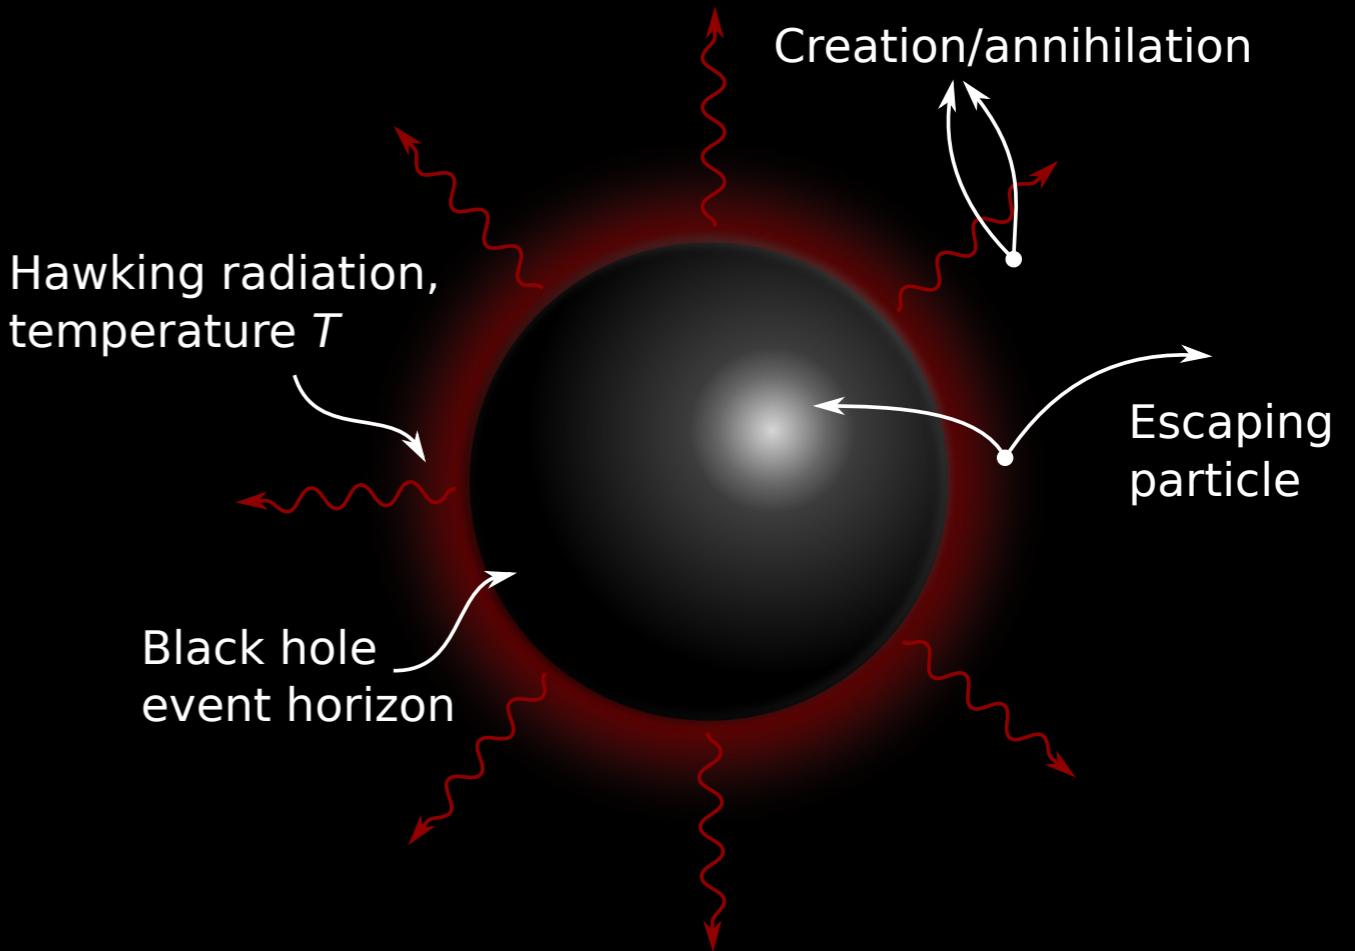

Hawking discovered that quantum effects close to the horizon creates radiation

But black holes are not black!

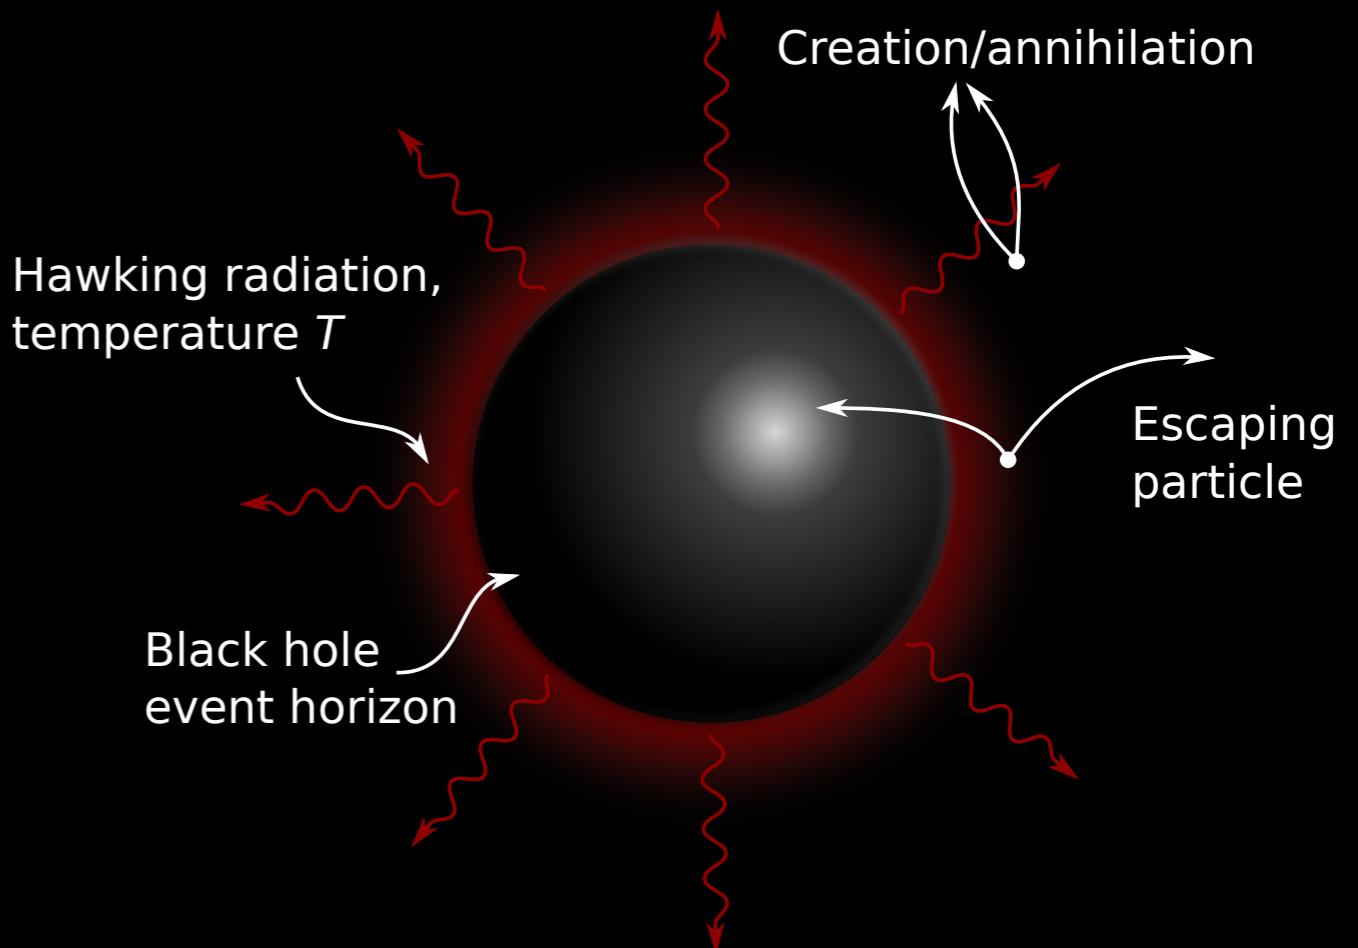

Quantum fluctuations outside
the horizon cause pair creation

A particle with negative energy goes
into the hole, while a positive energy
particle escapes to infinity

Quantum fluctuations outside the horizon cause pair creation

A particle with negative energy goes into the hole, while a positive energy particle escapes to infinity

Hawking radiation!

Black holes behave like a black body with entropy

$$S = \frac{\text{Area}}{4G_N\hbar}$$

Bekenstein-Hawking
formula

Black holes behave like a black body with entropy

$$S = \frac{\text{Area}}{4G_N \hbar}$$

Bekenstein-Hawking
formula

This is an amazing equation!

Statistical Physics = $\frac{\text{Gravity}}{\text{Quantum Mechanics}}$

Statistical Physics = $\frac{\text{Gravity}}{\text{Quantum Mechanics}}$

This relates three
pillars of theoretical physics!

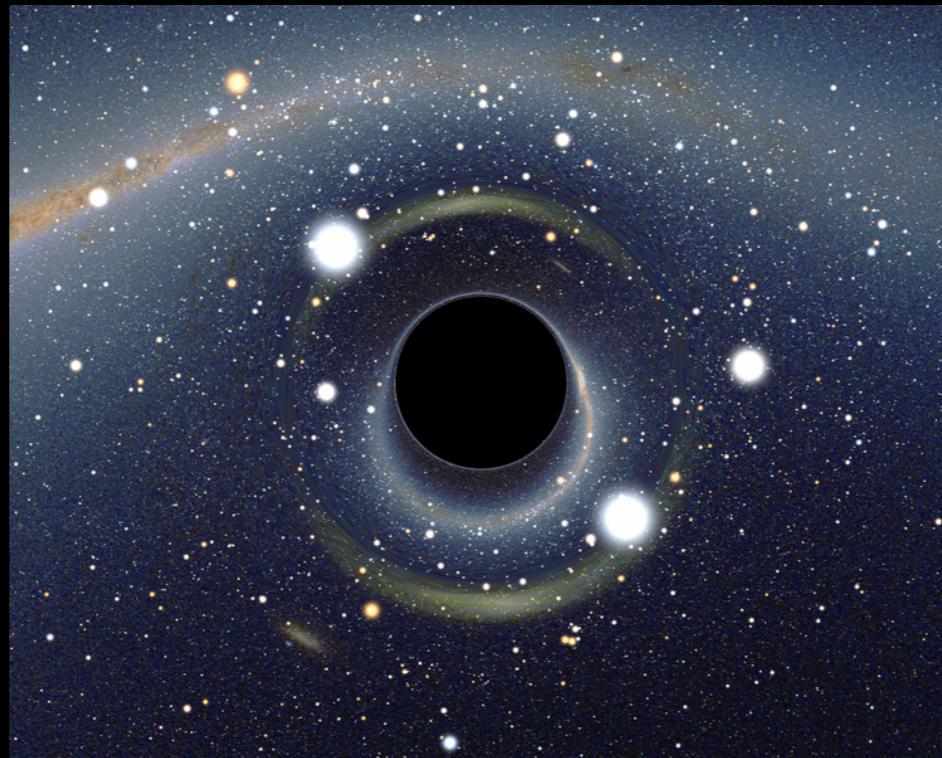

A **quantum theory of gravity** must be able to provide a microscopic account for the black hole entropy

$$S = \log (\# \text{ microstates})$$

But there is a fundamental problem with this picture:

$|\text{pure}\rangle$ $\xrightarrow{\text{IN}}$

$\xrightarrow{\text{OUT}}$ mixed state

But there is a fundamental problem with this picture:

Information is lost. Unitarity is violated.

String theory is a candidate for a quantum theory of gravity.
What does it have to say?

Crash course in string theory

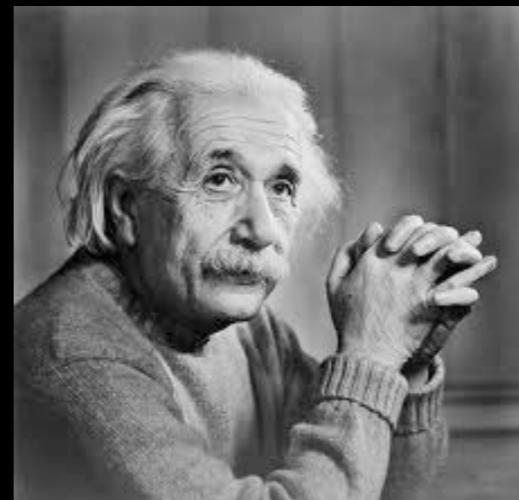

Elementary particles

Vibrating strings of energy

The vibrational modes of closed strings correspond to gravitons

String theory contains Einstein's
general theory of relativity!

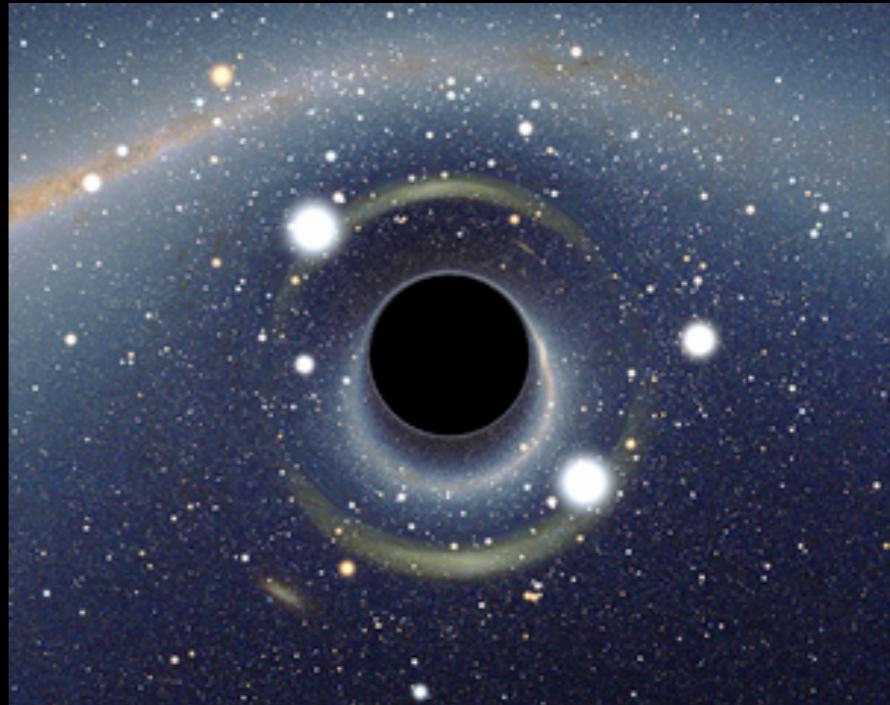

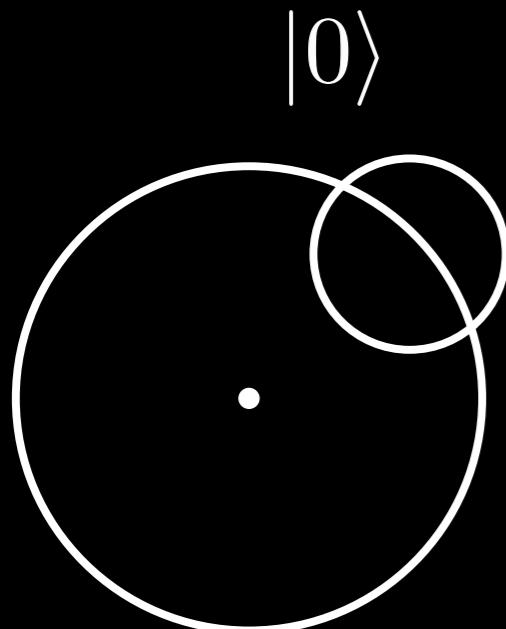

We can “build” black holes out
of bounds states of strings
and branes

When the system becomes sufficiently
massive it **gravitates** and a
black hole forms

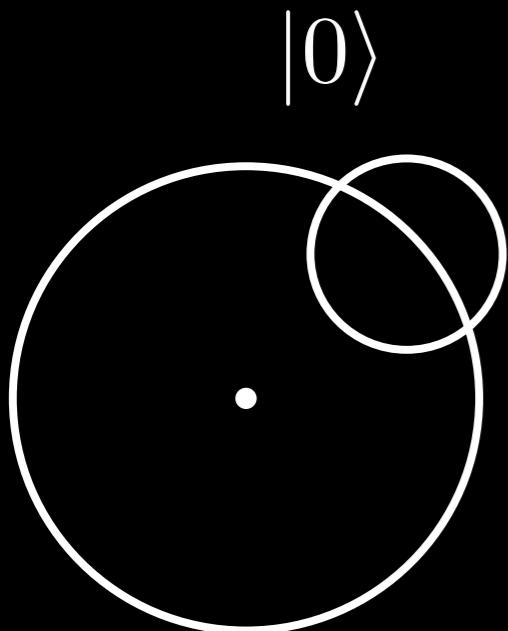

In string theory a “quantum black hole”
does not have a horizon in the traditional sense.

The horizon is **no longer
in a vacuum state**

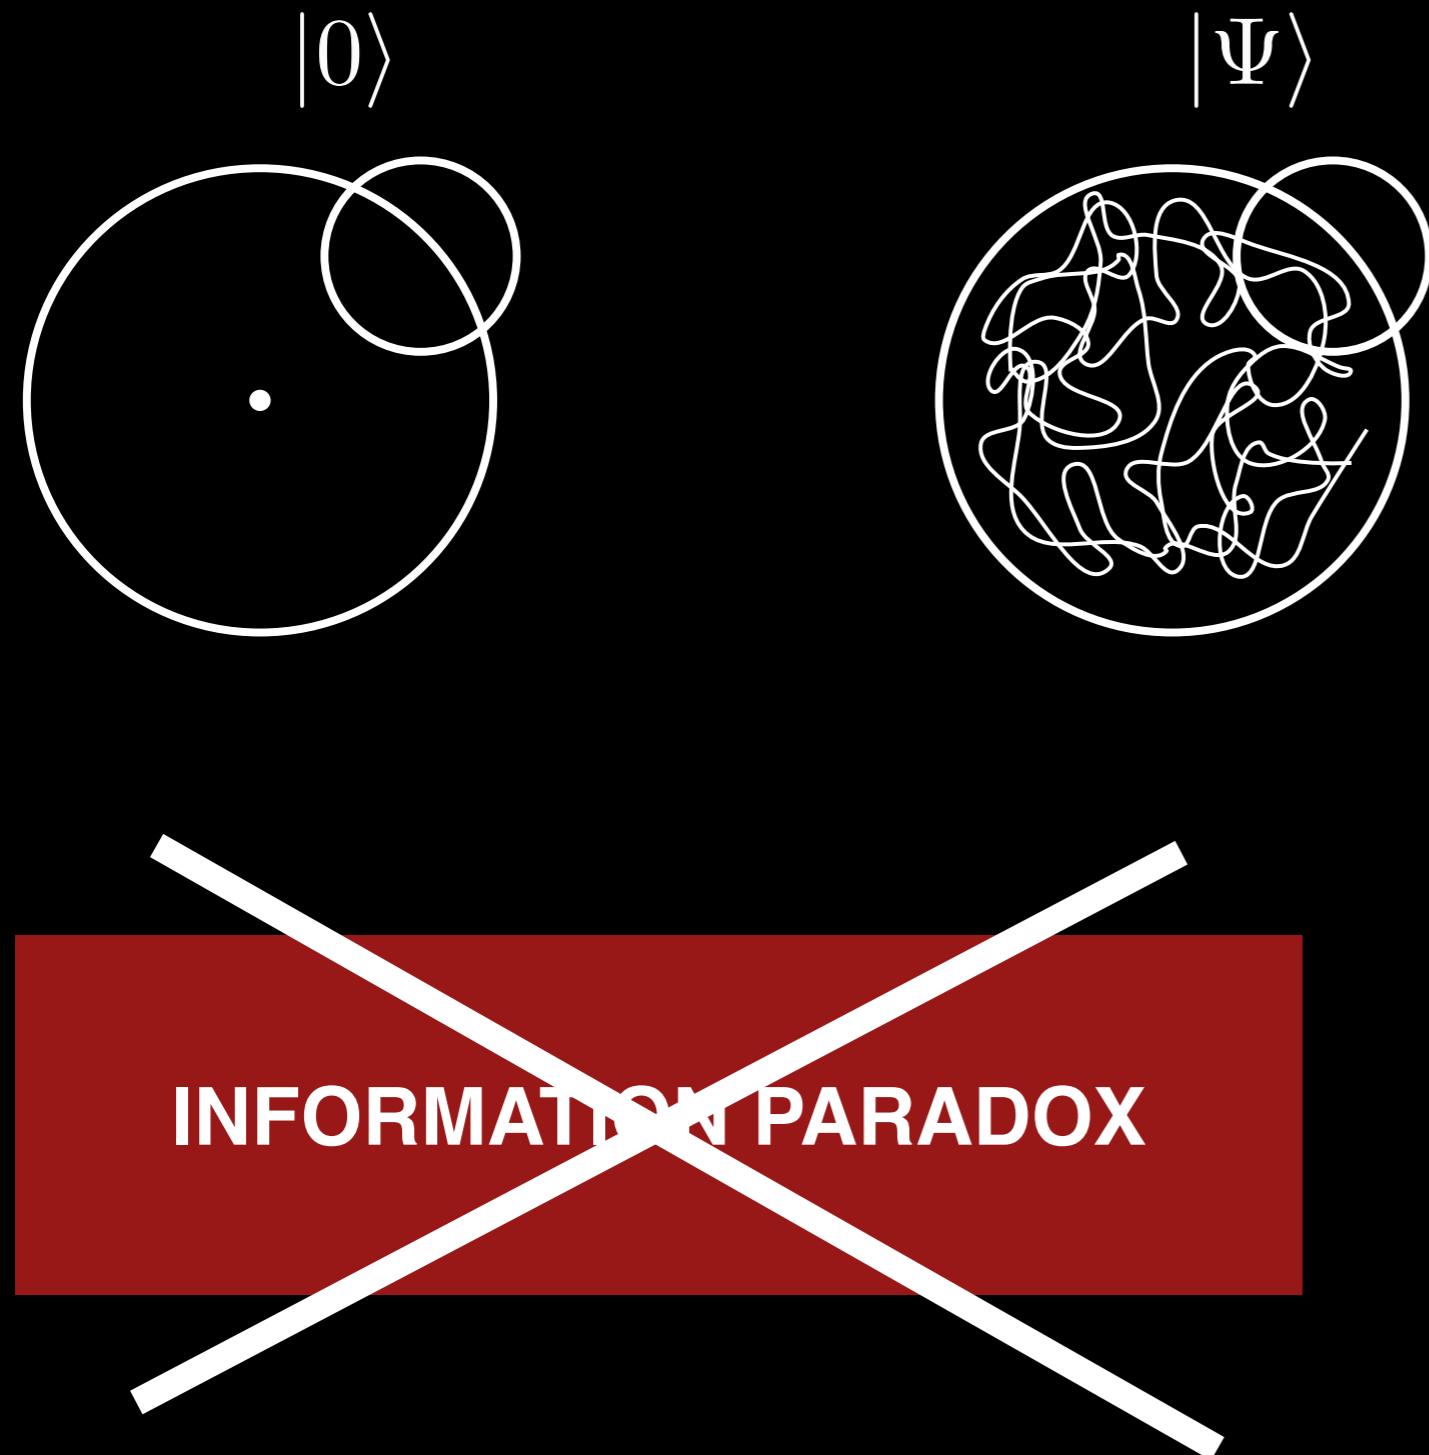

In string theory a “quantum black hole”
does not have a horizon in the traditional sense.

A stringy black hole has hair!

In string theory a “quantum black hole”
does not have a horizon in the traditional sense.

How to test Boltzmann's formula?

$$S = \log (\# \text{ microstates})$$

The solution to our problem hides in the equations of Ramanujan!

$$\begin{aligned}
 & (1+\alpha) \left\{ \frac{v}{(1-\alpha v)(1-\frac{v}{\alpha})} + \frac{\frac{q^4(1+\alpha v^2)^2}{(1-\alpha v)(1-\alpha v^2)(1-\frac{v}{\alpha})(1-\frac{v^3}{\alpha})}}{(1+\alpha v)(1+\alpha v^2)} \right. \\

 \end{aligned}$$

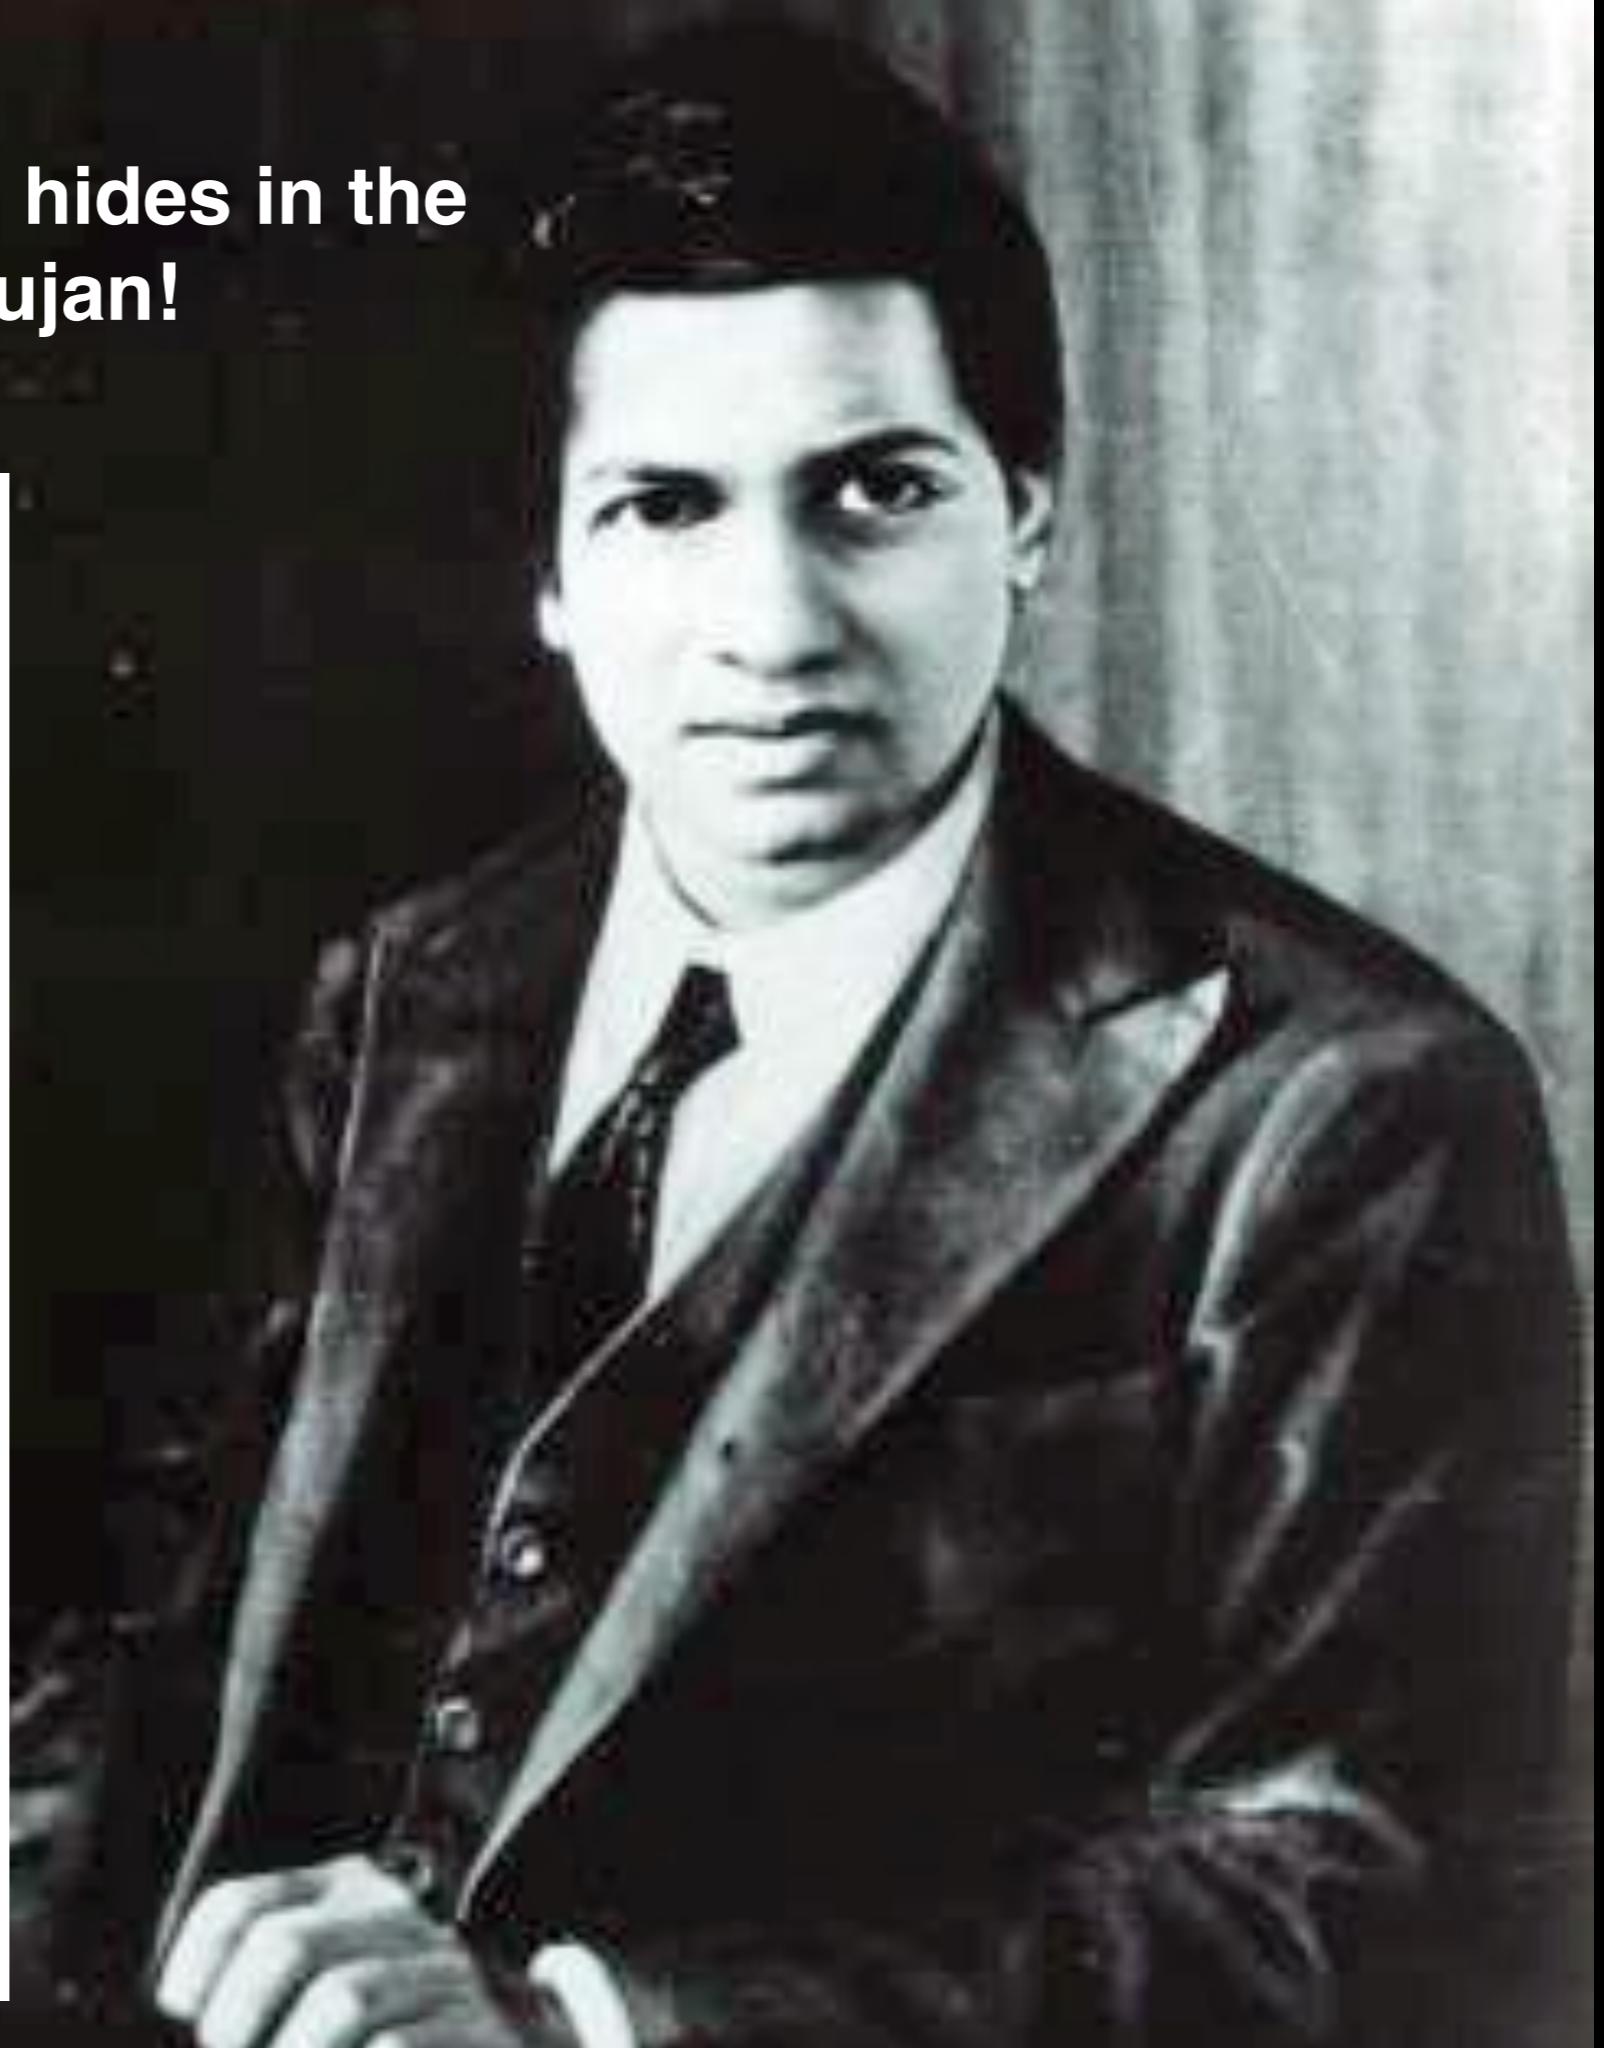

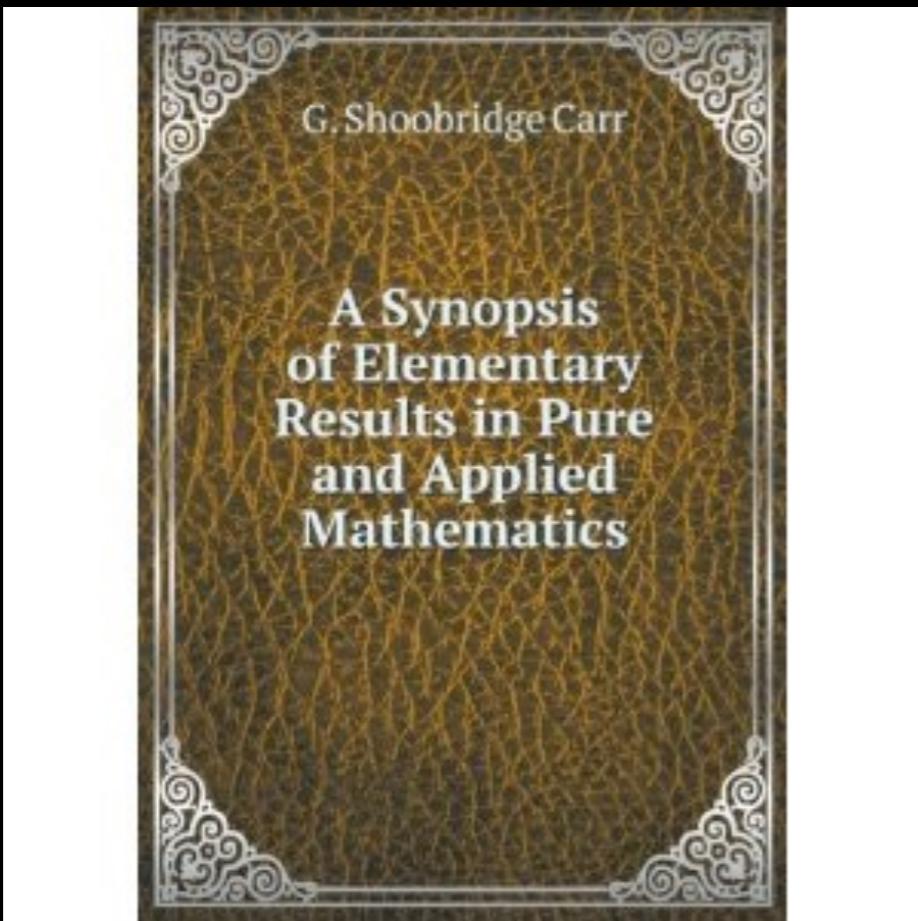

FIG. 1. Power series computations and comparisons from Ramanujan's "Lost" Notebook.

Srinivasa Ramanujan (1887-1920)

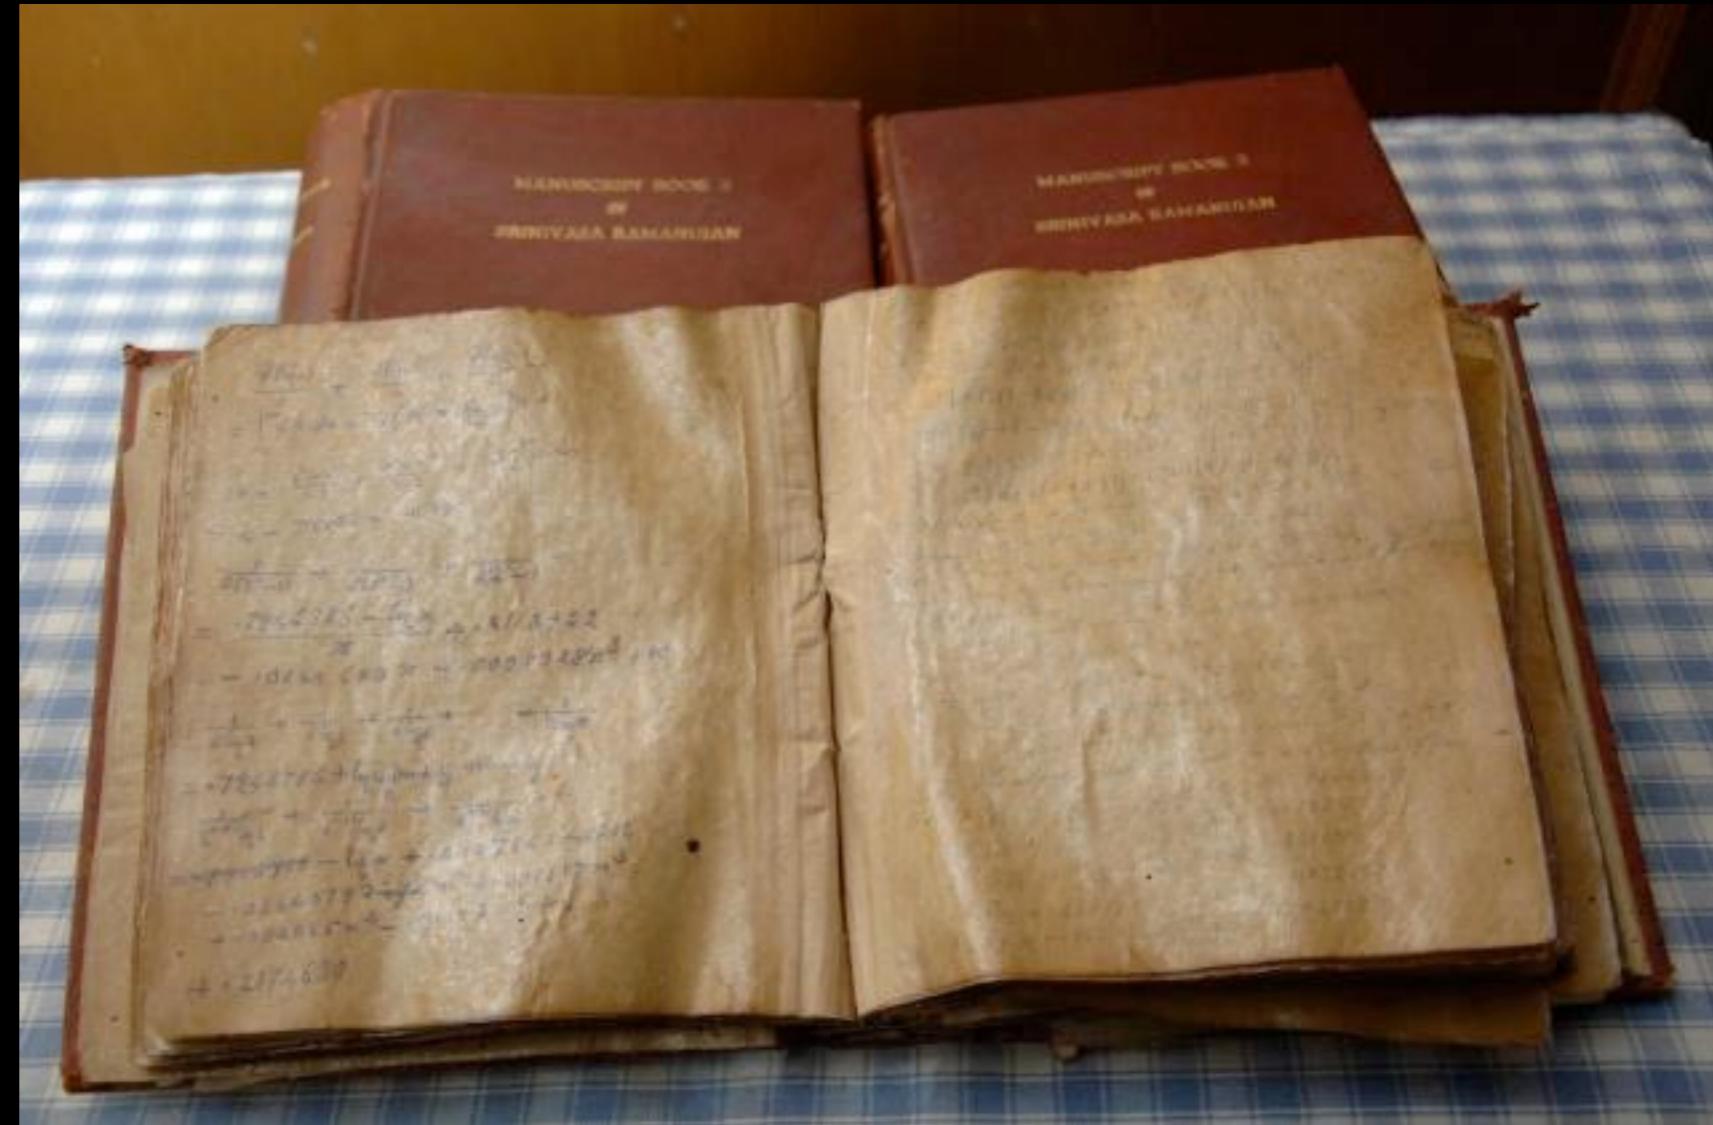

Born in a small village on the east coast of India

At the age of 11 he got his first mathematics book

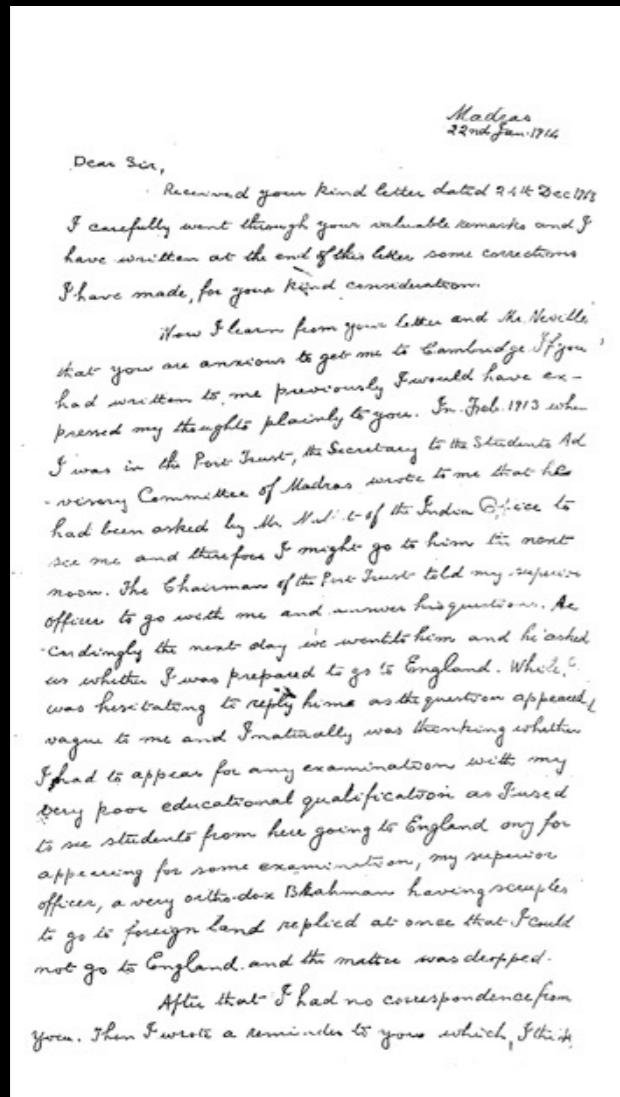

Ramanujan was absorbed by the world of mathematics and ignored all other subjects at school

He dropped out of school and pursued mathematics alone for many years

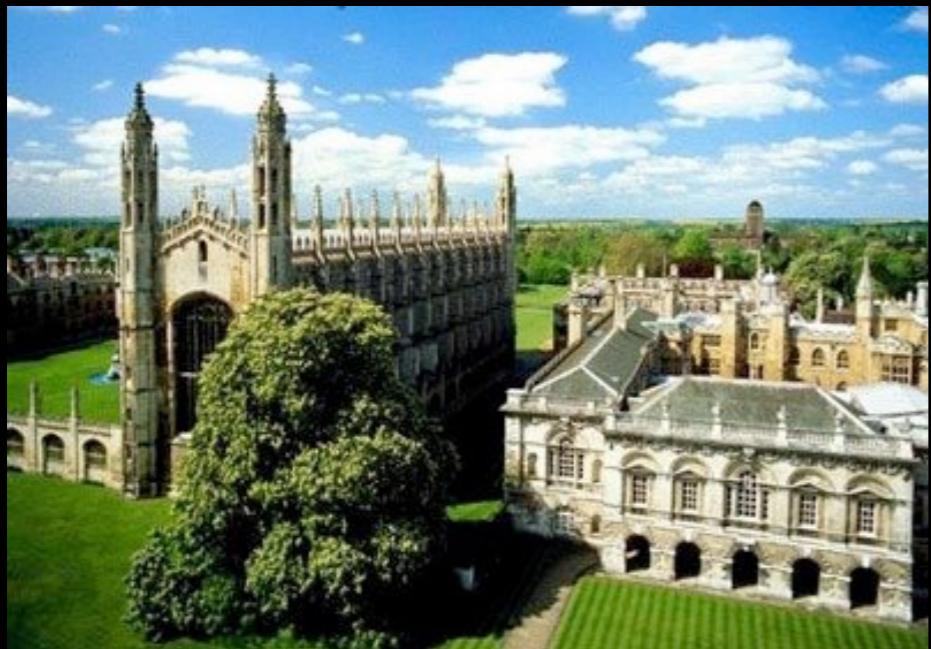

At the age of 25 he wrote letters to several british mathematicians, but for a long time received no replies

1913 he wrote a thick letter to the famous mathematician G. H. Hardy at Cambridge

“One morning in 1913, he (Hardy) found, among the letters on his breakfast table, a large untidy envelope decorated with Indian stamps. When he opened it...he found line after line of symbols. He glanced at them without enthusiasm. [...] The script appeared to consist of theorems, most of them wild or fantastic... There were no proofs of any kind... A fraud or genius?”

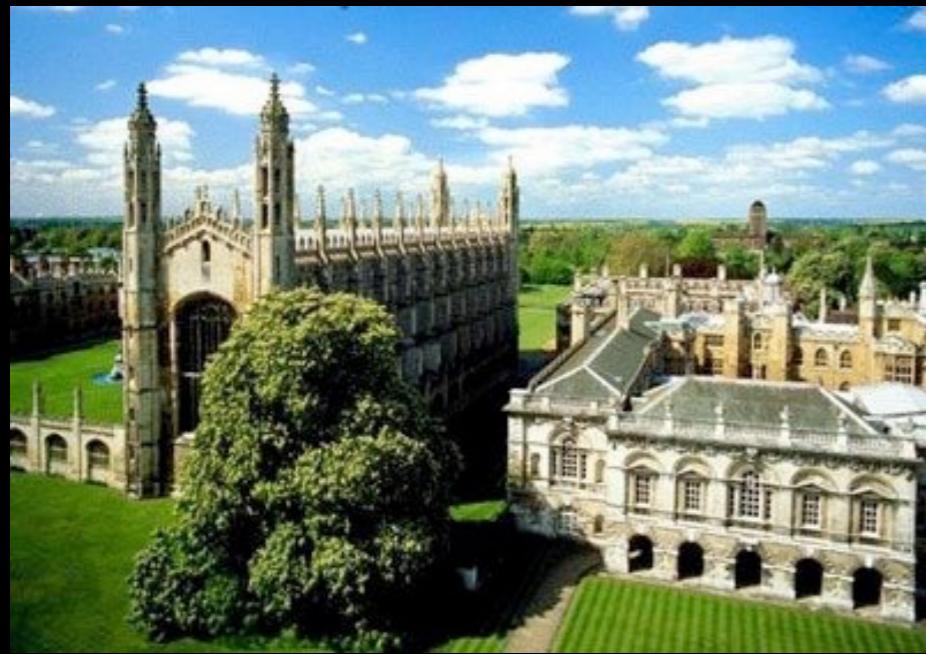

After much deliberation Hardy decided to invite Ramanujan to Cambridge in 1914

Over a period of 4 years Ramanujan wrote over 30 articles, many jointly with Hardy

“What was to be done in the way of teaching him modern mathematics? The limitations of his knowledge were as startling as its profundity.”

-Hardy

After much deliberation Hardy decided to invite Ramanujan to Cambridge in 1914

Recent movie about the life of Ramanujan!

“Taxi cab numbers”

1729

$$= 1^3 + 12^3$$

$$= 9^3 + 10^3$$

“Taxi cab numbers”

1729

$$\begin{aligned} &= 1^3 + 12^3 \\ &= 9^3 + 10^3 \end{aligned}$$

Ramanujan was particularly interested in series that correspond to partitions of integers:

$$f(q) = \sum_{n=0}^{\infty} p(n)q^n = 1 + q + 2q^2 + 3q^3 + \textcircled{5}q^4 + \dots$$

$$p(4) = 5 \iff 4 = 3 + 1 = 2 + 2 = 2 + 1 + 1 = 1 + 1 + 1 + 1$$

“Taxi cab numbers”

1729

$$= 1^3 + 12^3$$

$$= 9^3 + 10^3$$

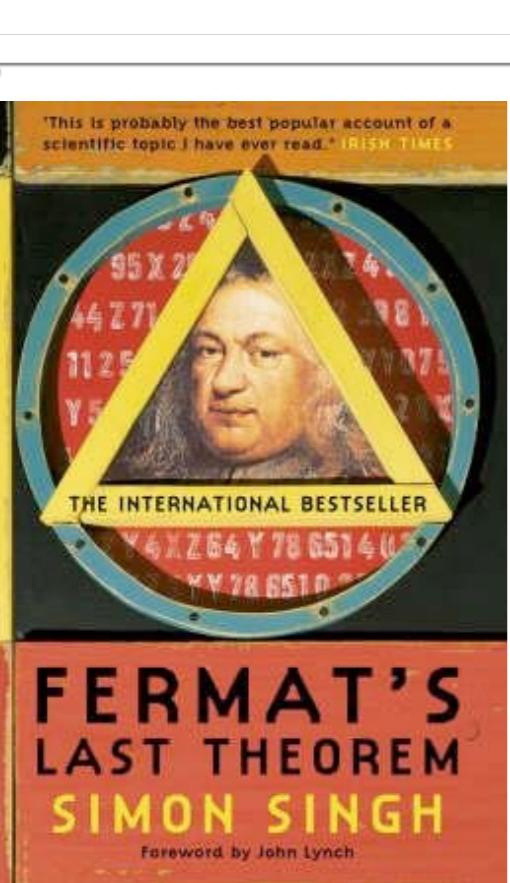

Ramanujan was particularly interested in series that correspond to partitions of integers:

$$f(q) = \sum_{n=0}^{\infty} p(n)q^n = 1 + q + 2q^2 + 3q^3 + \textcircled{5}q^4 + \dots$$

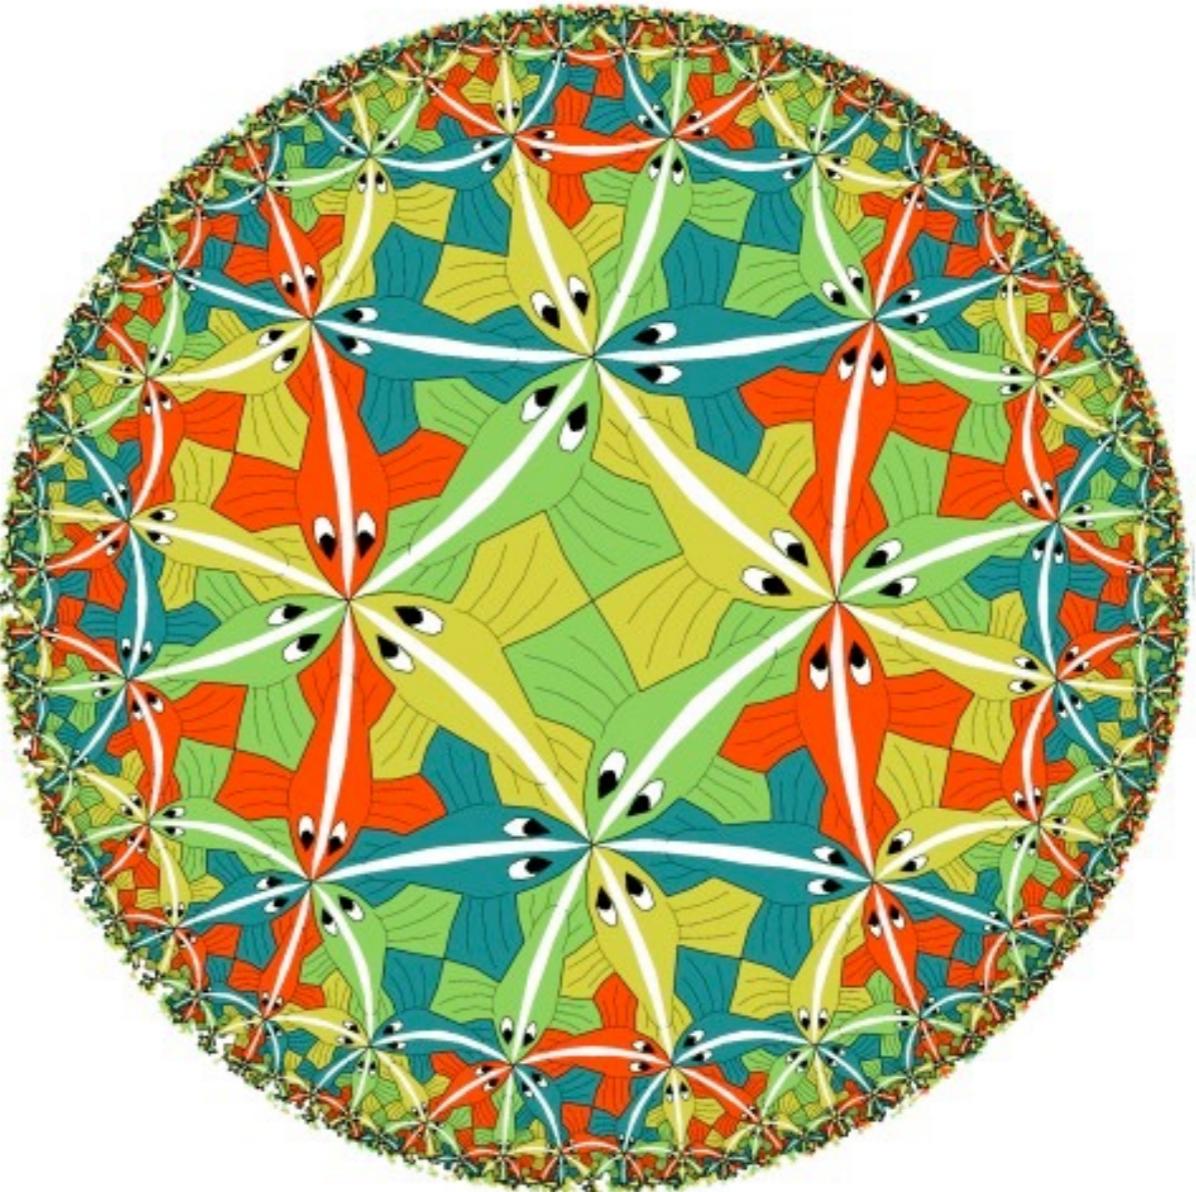

These often exhibit hidden symmetries, making them into *modular forms*

$$f(q) = \sum_{n=0}^{\infty} p(n)q^n = 1 + q + 2q^2 + 3q^3 + 5q^4 + \dots$$

These infinite series
often exhibit
hidden symmetries

“Modular Forms”

“Modular forms are some of the weirdest and most wonderful objects in mathematics.”

Ramanujans last letter

After 4 years in England Ramanujan became ill and returned to India in 1919.
He died in April 1920, only 33 years old.

3 months before his death he sent a
letter to Hardy listing 17 functions
that he claimed had
“amazing properties”

$$\begin{aligned}f(q) &= \sum_{n=0}^{\infty} \frac{q^{n^2}}{(1+q)^2 \cdots (1+q^n)^2}, \\ \phi(q) &= \sum_{n=0}^{\infty} \frac{(-q)^{n^2}}{(1+q^2)(1+q^4) \cdots (1+q^{2n})}, \\ \psi(q) &= \sum_{n=1}^{\infty} \frac{(-q)^{n^2}}{(1+q)(1+q^3) \cdots (1+q^{2n-1})}.\end{aligned}$$

Ramanujans last letter

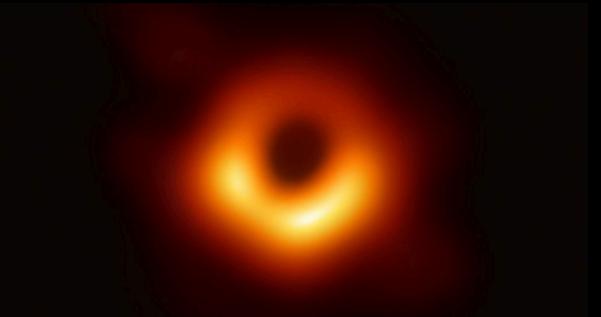

After 4 years in England Ramanujan became ill and returned to India in 1919. He died in April 1920, only 33 years old.

3 months before his death he sent a letter to Hardy listing 17 functions that he claimed had “amazing properties”

$$\begin{aligned} f(q) &= \sum_{n=0}^{\infty} \frac{q^{n^2}}{(1+q)^2 \cdots (1+q^n)^2}, \\ \phi(q) &= \sum_{n=0}^{\infty} \frac{(-q)^{n^2}}{(1+q^2)(1+q^4) \cdots (1+q^{2n})}, \\ \psi(q) &= \sum_{n=1}^{\infty} \frac{(-q)^{n^2}}{(1+q)(1+q^3) \cdots (1+q^{2n-1})}. \end{aligned}$$

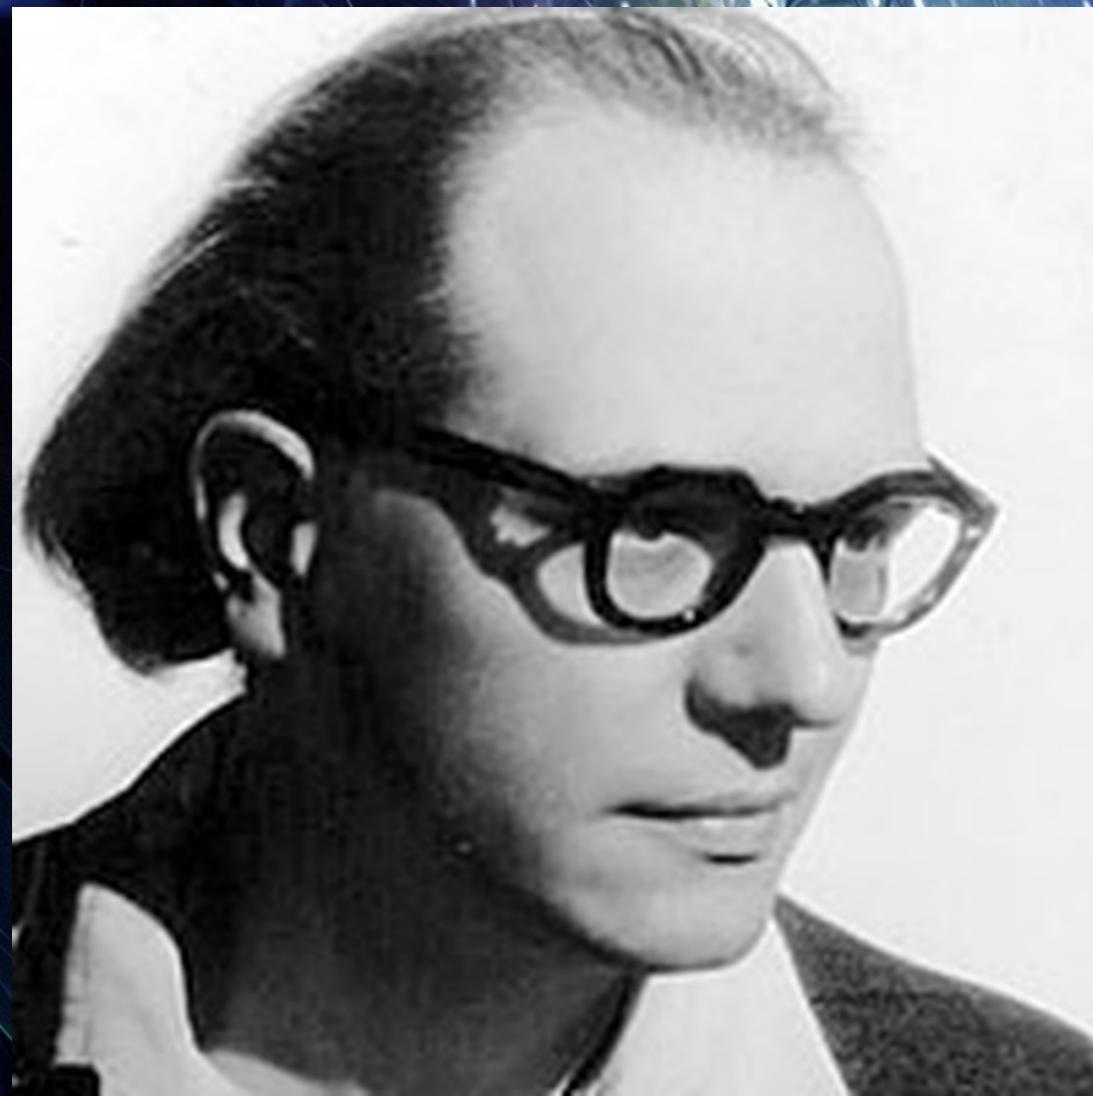

It took nearly 100 years and generations of mathematicians before the secrets of the last letter where finally unravelled...

The functions that Ramanujan wrote down turns out to have unexpected hidden symmetries that directly help to understand the quantum entropy of black holes!

“Île de feu 2”
(Island of fire)

Olivier Messiaen 1949

The image shows three staves of musical notation for a piano or similar instrument. Measure 8 starts with a forte dynamic (ff) and includes markings for 'interversion I' and 'interversion II'. Measure 12 follows with dynamics ff, f, p, ff, f, ff, ff. Measure 16 starts with a very forte dynamic (fff) and includes markings for 'interversion III' and 'interversion IV'. The music is written in common time with various clefs (G, F, C) and includes accidentals such as sharps and flats.

This piece of music has the same symmetries as Ramanujan's functions!

Let us bring the stories together

Goal: To calculate the black hole entropy

Entropi = Log (# states)

Let us bring the stories together

Goal: To calculate the black hole entropy

$$S(Q) = \log W(Q)$$

Entropy for a black hole with electric charge Q

Let us bring the stories together

Goal: To calculate the black hole entropy

$$S(Q) = \log W(Q)$$

Number of quantum states

Let us bring the stories together

Goal: To calculate the black hole entropy

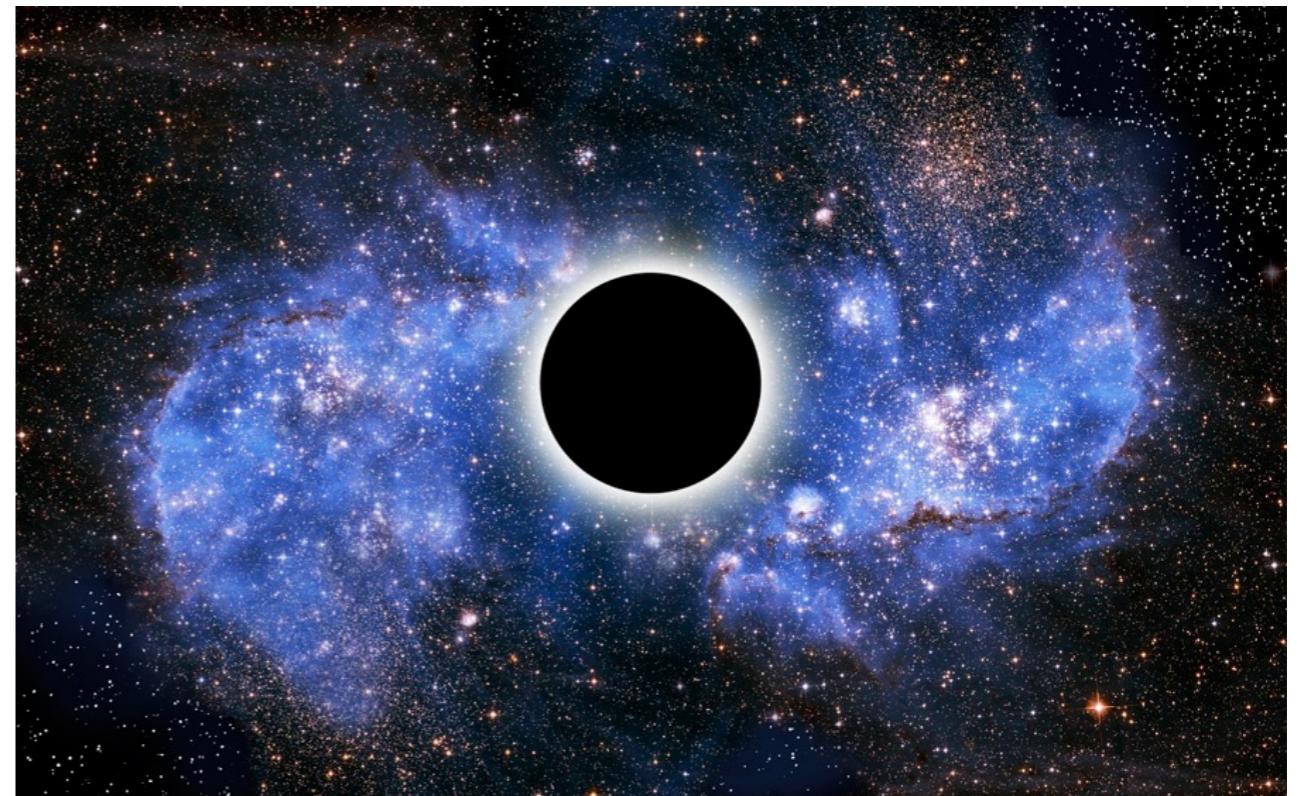

$$S(Q) = \log W(Q)$$

We now collect all this information in a **partition function**

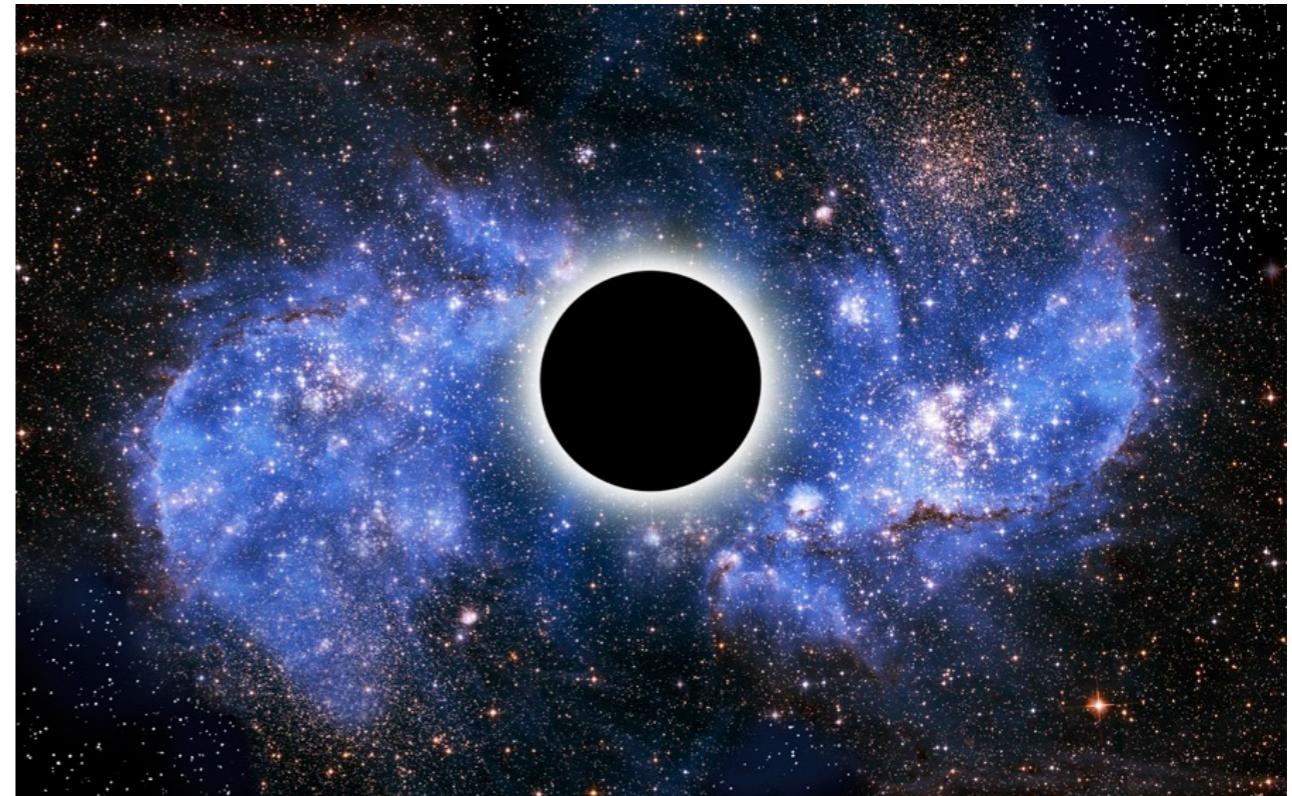

$$\Psi(q) = \sum_Q W(Q) q^Q$$

sum over all charges

$$\Psi(q) = \sum_Q W(Q) q^Q$$

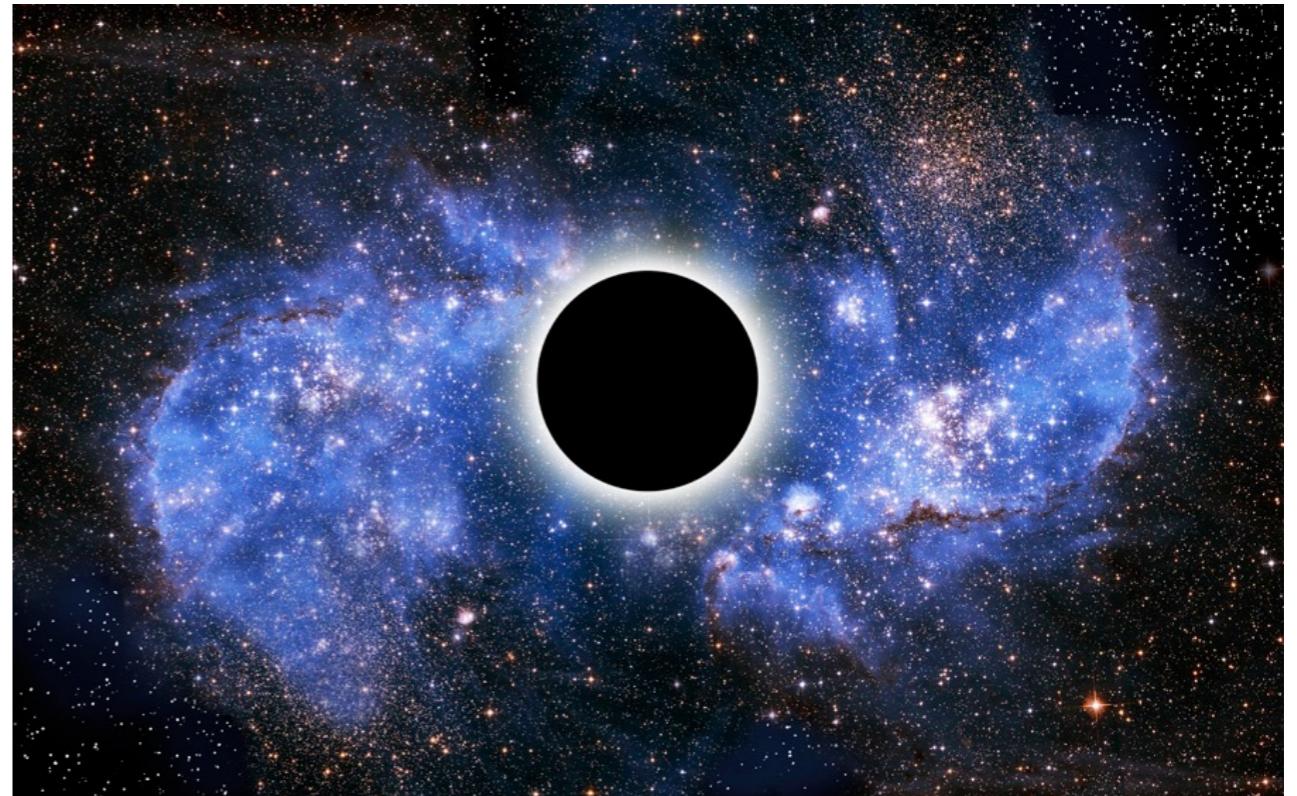

$$\begin{aligned}
& (1+\alpha) \left\{ \frac{v}{(1-\alpha v)(1-\frac{v}{\alpha})} + \frac{\frac{q^{1+\alpha v}(1-\alpha v)^2}{1+v^2}}{(1-\alpha v)(1-\alpha v^2)(1-\frac{v}{\alpha})(1-\frac{v^2}{\alpha})} \right. \\
& \quad \left. + \frac{v^2(1+\alpha)}{1+v^2} \dots \frac{(1+v^2)}{(1-\alpha v)(1-\alpha v^2)(1-\alpha v^4)} \right\} \\
& - \left\{ \frac{1}{1-\alpha v} + \frac{q(1+\alpha)}{(1-\alpha v)(1-\alpha v^2)} + \frac{v^2(1+\alpha)(1+\alpha v)}{(1-\alpha v)(1-\alpha v^2)(1-\alpha v^4)} \right\} \\
& = \frac{(1+\alpha)(1+\alpha v)(1+\alpha v^2)}{(1-\alpha v)(1-\alpha v^2)(1-\alpha v^4)} \left\{ \frac{1}{(1-\alpha v)(1-\alpha v^2)} \right. \\
& \quad \left. + \frac{v^2}{(1-\alpha v)(1-\alpha v^2)(1-\alpha v^4)} + \frac{v^4}{(1-\alpha v)(1-\alpha v^2)(1-\alpha v^4)} \right\} \\
& = \frac{1}{(1-\alpha v)(1-\frac{v}{\alpha})} + \frac{\alpha v(1+\frac{v}{\alpha})(1+\frac{v^2}{\alpha})}{(1-\alpha v^2)(1-\alpha v^4)(1-\frac{v^2}{\alpha})} \\
& v + \frac{v^2(1+\alpha v)(1+\alpha v^2)}{1+c v} + \frac{v^3(1+\alpha v)(1+\alpha v^2)(1+\alpha v^4)}{(1+c v)(1+c v^2)} \\
& = \frac{c}{\alpha v} \left\{ \frac{v(c+1)}{(\frac{c}{\alpha}-v)(\frac{c}{\alpha}-v)} + \frac{v^2(c+1)(c+v)}{(\frac{c}{\alpha}-v)(\frac{c}{\alpha}-v^2)(\frac{c}{\alpha}-v^4)} \right. \\
& \quad \left. + \frac{v^6(c+1)(c+v)(c+v^4)}{(\frac{c}{\alpha}-v)(\frac{c}{\alpha}-v^2)(\frac{c}{\alpha}-v^4)} \right\} \\
& - \frac{c}{\alpha v} \cdot \frac{(1+\alpha v)(1+\alpha v^2)\dots(1+\alpha v^4)(1+\alpha v^6)}{(1+c v)(1+v^2)(1+c v^2)} \\
& \times \left\{ \frac{v}{(\frac{c}{\alpha}-v)(\frac{c}{\alpha}-v)} + \frac{v^2}{(\frac{c}{\alpha}-v)(\frac{c}{\alpha}-v^2)(\frac{c}{\alpha}-v)(\frac{c}{\alpha}-v^4)} \right\} \\
& 1 + \frac{(c+v)}{(c+v)(c+v^2)} + \frac{v(c+v)(c+v^2)v^2}{(c+v)(c+v^2)(c+v)(c+v^2)} \\
& + c(1+\frac{v}{\alpha})(1+\frac{v}{\alpha}) \left\{ \frac{v}{(\frac{c}{\alpha}-v)(\frac{c}{\alpha}-v)} + \frac{v^2(c+v)}{(\frac{c}{\alpha}-v)(\frac{c}{\alpha}-v^2)(\frac{c}{\alpha}-v)(\frac{c}{\alpha}-v)} \right\} \\
& = \frac{(1+\frac{v}{\alpha})(1+\frac{v}{\alpha})(1+\frac{v}{\alpha})\dots(1+\frac{v}{\alpha})(1+\frac{v}{\alpha})}{(1-\frac{\alpha v}{c})(1-\frac{\alpha v^2}{c})\dots(1-\frac{\alpha v^4}{c})(1-\frac{\alpha v^6}{c})} \\
& \times (1+\frac{v}{\alpha})(1+\frac{v}{\alpha})(1+\frac{v}{\alpha})(1+\frac{v}{\alpha}) \\
& \frac{1}{1+a} - \frac{v}{1+\alpha v} + \frac{v}{\alpha+v} + \frac{v^2}{1+\alpha v^2} + \frac{v^2}{\alpha+v^2} - \\
& = \frac{1-2v}{(1+a)+2v(\frac{1}{\alpha}+v^2)} + \frac{v^2(1-\alpha v^2)}{(1+a)+2v(\frac{1}{\alpha}+v^2)} + \frac{v^2(1-\alpha v^4)}{(1+a)+2v(\frac{1}{\alpha}+v^4)} \\
& = (1+v+v^2+v^4) \left\{ 1 - \frac{v(v-v)}{(1+\alpha v)(1+\frac{v}{\alpha})} + \frac{v^4(v+v)(2v^2)}{1+\alpha v^2} \right\}
\end{aligned}$$

This turns out to be precisely one of the functions of Ramanujan's last letter

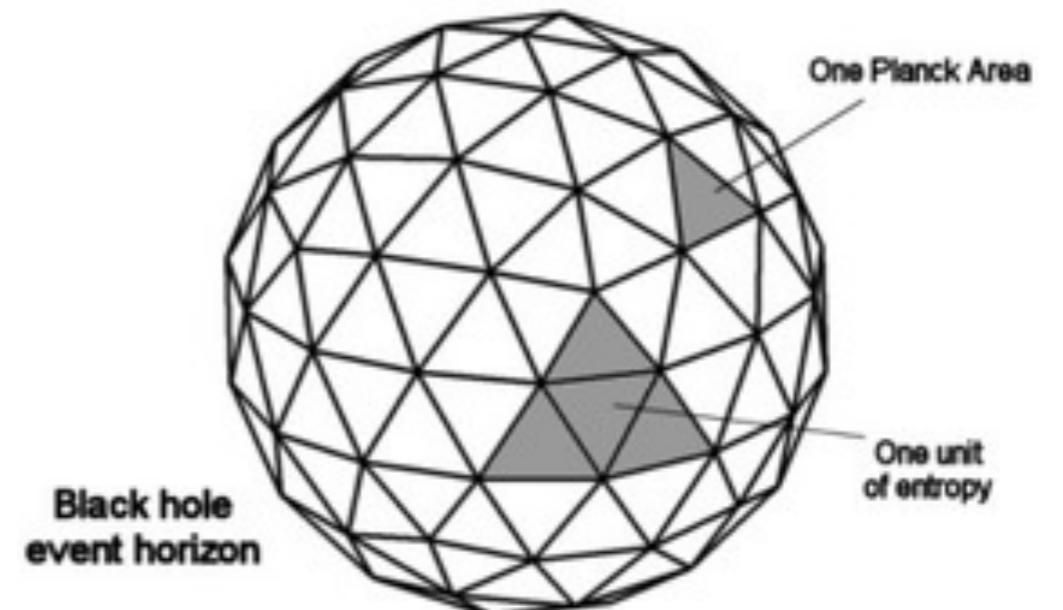

$$f(q) = \sum_{n=0}^{\infty} p(n) q^n = 1 + q + 2q^2 + 3q^3$$

$$\Psi(q) = \sum_Q W(Q) q^Q$$

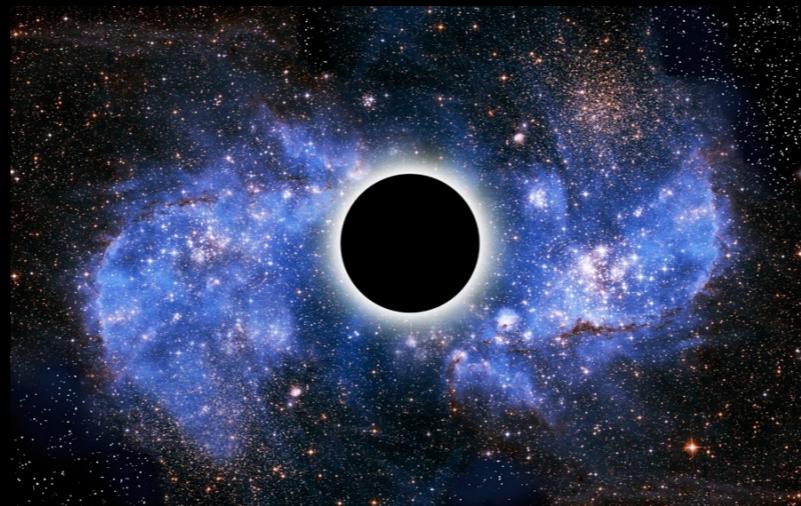

**Black hole microstates organized into
according to a huge symmetry**

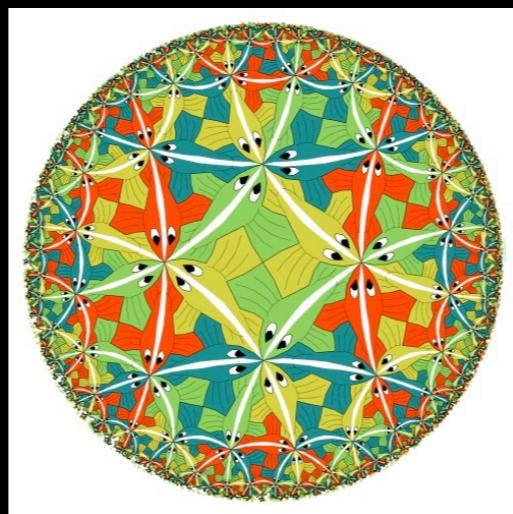

Three snippets of a musical score are shown, labeled m.8, m.12, and m.16. Each snippet includes musical notation on two staves, dynamic markings like 'ff' (fortissimo), and labels 'interversion I', 'interversion II', 'interversion III', and 'interversion IV'. The music consists of complex patterns of eighth and sixteenth notes.
